Network Discharge Consent Annual Report

2025-2026 Annual Performance Report

Final - November 2026

Watercare

QUALITY INFORMATION

Document	Annual Performance Report
Date	23 November 2026
Name and position of originator:	
Section 1 to 4	Jaini Croos (Environmental Scientist); Michaela Yee (Data Analyst)
Section 5 Inflow and Infiltration	Poonam Samuel (Programme Lead- Wastewater)
Section 6 Network Improvements **Section 7 New Assets**	Maria Utting (Team Leader- Wastewater Networks Planning); Andrew Deutschle (Head of Wastewater Planning)
Section 8 Public Information	Melissa Gardi (Marketing Communications Manager); Moana Williams (Community Relations & Consultation Manager)

Revision History

Revision Date	Name	Position	Signature
20/11/2026	Michiel Jonker	Environmental Care Manager	
05/11/2026	Jonathan Piggot	Head of wastewater	

Approved

Date	Name	Position	Signature
20/11/2026	Michiel Jonker	Environmental Care Manager	

EXECUTIVE SUMMARY

This report summarises Watercare's performance against the Auckland-wide Network Discharge Consents (NDC) for the period 1 July 2025 to 30 June 2026. It outlines wastewater network performance, overflow trends, infrastructure improvements, operational initiatives and progress in understanding the environmental effects of wastewater overflows.

Alignment with national performance reporting

In addition to its reporting obligations under the NDC, Watercare reports wastewater network performance against national performance measures administered by the Department of Internal Affairs (DIA), as well as performance obligations under the Commerce Commission's Watercare Charter.

While these reporting frameworks draw on the same underlying wastewater overflow data, differences in reporting definitions and methodologies can result in different performance figures. In particular, the national reporting framework classifies dry-weather overflows as those occurring when less than 1 mm of rainfall has fallen in the preceding 24 hours, compared with the 10 mm threshold used for NDC reporting.

Applying the national threshold results in 2,598 dry-weather overflows and 2,960 wet-weather overflows for the reporting year 2025-2026, compared with 3,935 dry-weather overflows under the 10 mm threshold. This difference reflects the classification methodology rather than a change in the total number of recorded overflows.

Watercare's Wastewater Performance Report 2025-26 provides a complementary overview of network performance using the national reporting definitions, supporting transparency and consistency across its regulatory reporting obligations.

Network performance

During the 2025-26 reporting period, Watercare recorded 4,557 Type 1 and Type 3 wastewater overflows. This represents a 2.8 % reduction from 4,686 in the previous reporting period. This comprised of:

- 3,376 dry-weather overflows (DWOs), a reduction of 7.2 %
- 1,181 wet-weather overflows (WWOs), an increase of 12.6 %

The number of Type 3 incidents classified as Level 3 or above decreased from 63 to 27, representing a 57% reduction. This is a positive result, although wastewater overflows remain a significant operational and environmental management challenge.

An additional 1,001 Type 2 overflow alarms were recorded during 2025-2026. These telemetry-derived alarms are reported separately from the Type 1 and Type 3 overflow totals.

Performance drivers

Blockages remained a major contributor to uncontrolled wastewater overflows, particularly those associated with roots, fats, oils and grease, and other obstructions. Wet-weather performance continued to be affected by network capacity constraints and rainfall-related inflow and infiltration.

Overflows remained concentrated in several catchments, particularly Upper Tāmaki River, Western Isthmus, Hobson Bay, Henderson Creek and East Coast Bays. These catchments continue to be priorities for network improvements, targeted investigations and operational interventions.

Network improvements

Watercare continued delivering infrastructure improvements and renewals to increase wastewater conveyance capacity, improve resilience and reduce overflow risks. Major programmes included the Central Interceptor, Northern Interceptor, Western Isthmus Water Quality Improvement Programme and targeted upgrades across priority catchments. The benefits of these investments are expected to be realised progressively as projects are completed and commissioned.

A significant operational development during the 2025-2026 reporting year was the rollout of Watercare's Smart Network Programme, with approximately 4,500 wastewater level sensors installed across Auckland. Supported by AI-based analysis, these sensors will improve visibility of network performance, help identify abnormal responses to rainfall and blockages, and enable more targeted inflow and infiltration investigations and maintenance activities.

Public information and engagement

Watercare continued public information and engagement activities aimed at improving awareness of wastewater network performance, overflow risks and appropriate wastewater system use. These included customer education, community engagement, digital communications and information provided through Safeswim. These initiatives complement infrastructure and operational improvements by supporting public awareness of receiving-environment risks and encouraging behaviours that help prevent avoidable wastewater blockages and overflows.

Targeted Monitoring Plan

Watercare continued progressing the Targeted Monitoring Programme (TMP), which is required under the NDC to assess whether the risk assessment methodology in Attachment 5 (of the NDC) appropriately characterises the recreational, public-health and ecological effects of wastewater overflows.

During 2025-2026, findings from the freshwater and marine pilot investigations and subsequent technical assessments informed the development of a revised, freshwater and marine TMP. Continuous water-quality monitoring did not identify clear evidence of persistent downstream degradation attributable to wastewater overflows, although short-duration or event-specific effects could not be ruled out.

Initial technical assessments suggest that the Attachment 5 methodology provides a reasonably robust and conservative framework for assessing overflow risks, although further monitoring is required to confirm its effectiveness. The revised TMP will be submitted to Auckland Council for review and approval, with monitoring findings used to inform any necessary refinements to the assessment methodology in accordance with Condition 62 of the NDC.

Priorities

Priorities for 2026-27 include progressing major network infrastructure improvements, reducing recurring overflows, strengthening inflow and infiltration management, using smart-network monitoring data to improve operational decision-making, and implementing the revised Targeted Monitoring Programme.

1 INTRODUCTION

1.1 Background

Watercare Services Limited (Watercare) provides wastewater services across Auckland, from Wellsford in the north to Waiuku in the south. The network that conveys wastewater to Watercare's wastewater treatment plants (WWTPs) can overflow where blockages or surcharging occurs, and Watercare has resource consents for managing the associated discharges to the environment. These consents are known as Watercare's Auckland Wastewater Network Comprehensive Discharge Permits – the Auckland-Wide Network Discharge Consent (NDC). Auckland Council granted the NDC consent in June 2014.

The reporting condition is identical over all eight consents and states:

"The Consent Holder shall provide an Annual Wastewater Network Performance Report to the Manager on 30 September of each year. This report shall provide the information specified in the Template for the Annual Network Performance Report (Attachment 9) and include the annually updated version of Attachment 2."

As such, this annual performance report satisfies condition 57 of:

- DIS60083245 (R/REG/2013/3743) and CST60083182 (R/REG/2013/3755), which are the principal NDC consents
- CST60047515 (COA-63609), which extends the NDC to cover the network in Waiwera
- DIS60047640 (REG-63613), which extends the NDC to cover the network in Parakai
- DIS60047654 (REG-63614), which extends the NDC to cover the network in Helensville
- DIS60050020 (REG-67901), which extends the NDC to cover new pump stations in the Warkworth – Snells Beach catchment
- DIS60083293 (R/REG/2013/3755) and CST60083186 (R/REG/2013/3764) which are specific to the Western Isthmus and the Central Interceptor project

This report provides a summary of overflows that occurred between 1 July 2025 and 30 June 2026, as well as a brief overview of works in each geographical catchment area. These consents do not include Kawakawa Bay, for which the sewerage is transported within a vacuum system, and as such has a separate consent.

1.2 Scope

This report summarises the performance of Watercare's wastewater network, based on the recorded and reported overflows that occurred over the reporting period (1 July 2025 – 30 June 2026). Specifically, this report provides information on the following:

- Wastewater overflows from Watercare's wastewater network, both during times of dry weather and wet weather flows from both types of engineered overflow points:
    - Type-1 pump stations (PS)
    - Type-2 network relief points with telemetry
- Uncontrolled (Type-3) overflows which are typically reported through customer contact
- Watercare's Inflow and Infiltration Programme (I&I)
- The upgrade and improvement projects Watercare undertake to improve network performance

- Additions to the network in response to population growth and urban intensification
- Any updates or additions to the public information made available by Watercare
- An updated Targeted Monitoring Programme (TMP) including presenting the results of the Pilot TMP.

1.3 Data limitations

Watercare has strengthened its data collection processes since the previous reporting period. Despite these improvements, some variation remains in the accuracy and level of detail of the information presented, and additional work is required to achieve full consolidation of all Type 2 overflow alarm data.

1.4 Definition, abbreviations and acronyms

This report uses technical language and abbreviations for some terms. Watercare has made all efforts to define these terms in the text. For ease of reading Table 1-1 lists key technical terms and common abbreviations in this document. See Appendix A for further definitions.

Table 1-1: Abbreviations and terms

Abbreviation/ term	Description
Ammonia testing	Semi-quantitative instant tests for ammoniacal nitrogen (NH_4) and ammonia (NH_3)
Controlled overflow	A discharge from the network that occurs from an engineered overflow point, either during times of dry or wet weather flows
DWF	Dry-weather flow
DWO	Dry-weather overflow, which occurs when less than or equal to 10 mm of rainfall fell during the preceding 24 hours
EOP	Engineered overflow point
FWA	Fluorescent Whitening Agents – synthetic optical brighteners indicating wastewater contamination.
GWI	Groundwater infiltration
I&I	Inflow and infiltration
Level	The impact of the overflow from Level One spill to Level Five catastrophe (refer to Appendix A for more details)
LIM	Land Information Memorandum
NDC	Auckland-wide Network Discharge Consent
RDII	Rainfall derived inflow and infiltration
Repeat DWO	A Dry Weather Overflow that occurs more than once at the same location within a 12-month period
SCADA	Supervisory Control and Data Acquisition
SMA	Strategic Management Area
Type 1	Engineered overflow points at pump stations

Abbreviation/ term	Description
Type 2	Engineered overflow points along the wastewater network
Type 3	Uncontrolled overflows from the wastewater network
Uncontrolled overflow	A spill from any point in the network, during dry or wet weather flows
WIWQP	Western Isthmus Water Quality Programme
WWO	Wet-weather overflow, which occurs when more than 10mm of rainfall fell during the preceding 24 hours
WWPS	Wastewater pump station
WWTP	Wastewater treatment plant
FOG	Fats Oil Grease

1.5 Watercare's wastewater network

The wastewater network's core function is to convey untreated wastewater from residential, commercial, and industrial sources to a WWTP. These flows consist of dry weather flow and inflow and infiltration.

Dry-weather flow (DWF) includes domestic, commercial, and industrial discharges, along with groundwater infiltration (GWI), which occurs when water from the surrounding groundwater table enters the network. Overflows that occur during relatively dry conditions (≤ 10 mm of rainfall in the previous 24 hours) are classified by Watercare as dry weather overflows (DWOs).

Rainfall-derived inflow and infiltration (RDII) refer to stormwater that enters the wastewater system. This can result from defects such as cracked pipes, unsealed manholes, or incorrectly connected private stormwater drains. When an overflow occurs in wet conditions (> 10 mm of rainfall in the previous 24 hours) or is linked to network surcharging, Watercare records it as a wet weather overflow (WWO).

To reduce the likelihood of wastewater discharging onto private properties, the network has been designed with engineered overflow points (EOPs) that release flows during significant wet weather events. This approach aligns with common international practice among water utilities.

1.6 Sewerage types

There are two key sewerage types within the Auckland region: combined networks, predominantly found in the older areas of metropolitan Auckland, and separated networks.

1.6.1 Combined networks

Combined networks convey both wastewater and stormwater through a single pipe. These systems are designed to overflow during rainfall events, when stormwater inflows reduce available capacity.

To prevent uncontrolled discharges onto private properties or buildings, the network includes dedicated Type-2 EOPs. These EOPs release excess flow via a piped system or designated pathway into the local receiving environment.

Within Watercare's network, combined systems exist only in the Māngere Strategic Management Area (SMA), which encompasses the Māngere WWTP catchment. This area includes parts of the Western Isthmus (served by the Central Interceptor), Cox's Bay, the central business district (CBD), and Hobson Bay catchments. All other SMAs, including the Rosedale SMA that services much of the North Shore, operate as separated networks.

1.6.2 Separate networks

Separate wastewater networks are designed to carry only dry weather flows, apart from instances where I&I occur. Wet weather impacts on these systems arise from two main sources:

- **Inflow:** water entering the separated wastewater system through incorrectly or illegally connected roof downpipes, surface runoff, flooded manholes, or low-lying gully traps on private properties
- **Infiltration:** groundwater or surface water seeping into the system via cracks, defects, or disjointed joints in pipes. Infiltration affects both public and private wastewater assets

To manage capacity constraints, separate systems are equipped with engineered overflow structures at pump stations (Type-1 EOPs) and at selected points within the network (Type-2 EOPs). These relief points are designed to prevent uncontrolled discharges onto private properties by directing excess flows to locations where risks to public health and the environment are lower.

1.7 Watercare's response to overflows

Watercare manages wastewater overflows through two approaches:

- Immediate response
- Investigation and remediation

An agreed protocol with Auckland Council guides the way overflows are reported and managed. This protocol is set out in the Wastewater Overflow Regional Response Manual which is the Attachment 8 of the consent, originally developed with the Pollution Response and Licensing and Compliance Teams and signed in 2014.

Condition 37 of the Network Discharge Consent permits the consent holder to review and update Attachment 8. Watercare is preparing an update under this provision to reflect its current structure and processes. Since the last reporting period the update has completed an internal review and is now ready for review by the relevant Auckland Council departments, including health teams; once we receive their feedback, we will finalise the update.

1.7.1 Immediate response

Overflows are classified according to risk categories, as outlined in Appendix A. To assess potential sewage contamination, Watercare undertakes ammoniacal nitrogen testing in combination with visual and odour observations. Testing is carried out only when safe to do so and when there is access to the receiving watercourse. Where possible, samples are tested at the point of entry, 5 metres downstream, and 100 metres downstream.

Wastewater overflow pollution events are documented using "wastewater overflow incident assessment forms". For incidents classified as Level 3 and above, the manual requires Watercare to submit these forms to Auckland Council within ten working days.

If ammoniacal nitrogen concentrations exceed 6 ppm, follow-up sampling may be undertaken to confirm that remedial actions have been effective. Additional sampling may also be conducted by Auckland Council's Environmental Health Officers, if required.

1.7.2 Repeat issues

Investigating repeat DWOs can help identify underlying network or operational issues. A repeat DWO is defined as one occurring two or more times within a 12-month period. Overflows caused by blockages are initially addressed on site by contracted service providers following an overflow call-out. To prevent recurrence, service providers typically flush the lines to remove accumulated debris. If the blockage persists, CCTV inspections may be requested to determine the underlying cause. This approach, however, is time-intensive and not cost-effective for every overflow event.

Watercare monitors repeat overflows that remain unresolved within the reporting year and prioritises investigations for issues involving three or more spills over a rolling 24-month period. For dry weather repeats, investigations focus on identifying and mitigating the source of the blockage or damage. For wet weather repeats, the focus is on confirming whether infiltration or capacity constraints, rather than blockages, are contributing factors. Identified issues are escalated to the relevant teams either planning or I&I as they cannot be resolved through routine operational responses.

In some cases, new overflow points may be added to the Type-3 monitoring list (see 0) to improve incident tracking and management.

2 OVERVIEW OF THE NETWORK AND PERFORMANCE HIGHLIGHTS

2.1 Introduction

The NDC covers authorised discharges across 36 catchments in Auckland. This chapter outlines the characteristics of each catchment. The full consented area is shown in Figure 2-1 while Appendix B provides detailed maps for each catchment.

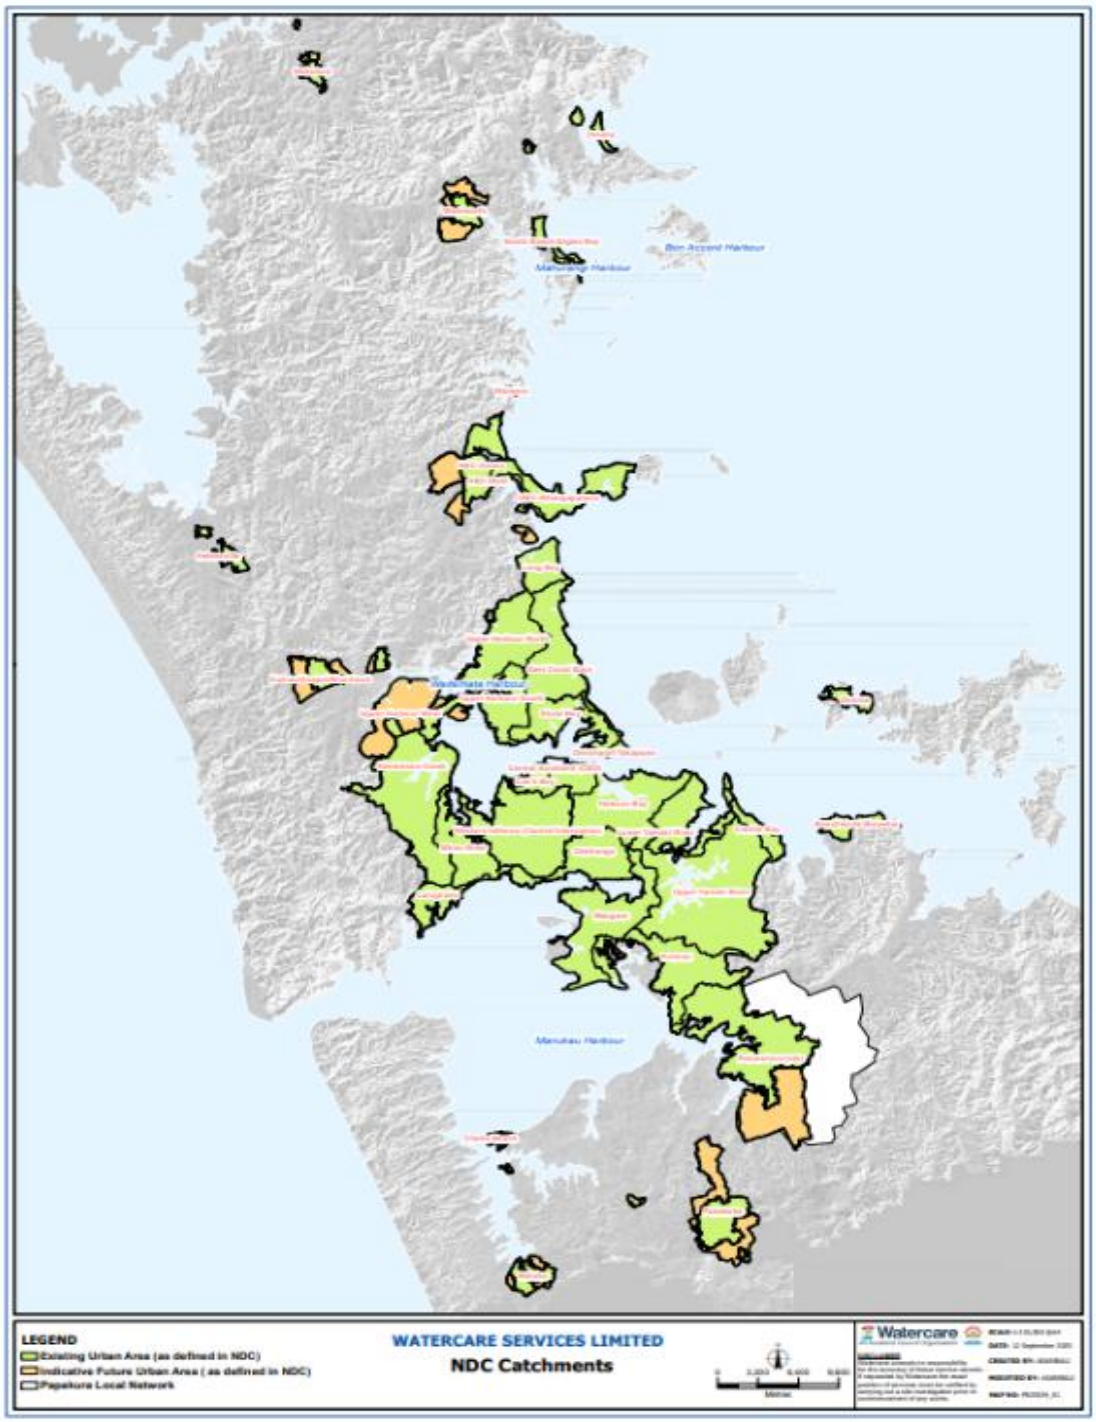

Figure 2-1: Map showing all 36 consented catchments in the NDC and associated consents

Watercare monitors key performance metrics and tracks network improvement projects at the catchment level. Considering factors such as geography, population growth, and ongoing development, enables Watercare to plan and operate the wastewater network effectively, ensuring reliable service across all Auckland communities.

2.2 Catchment details

This section provides a catchment-by-catchment overview of the wastewater network for the 2025–26 reporting period. F For each of the 36 catchments, key network metrics and year-on-year changes are presented, along with a summary of DWOs, WWOs, and catchment-specific network improvements. Detailed overflow analysis is provided in Sections 3 and 4, with improvement project details in Section 6.

2.2.1 Catchment 1 – Wellsford

Wellsford is a small township in a predominantly rural pastoral area. Wellsford is approximately 20 km inland from the Kaipara Harbour. Auckland Council has identified two indicative future urban areas to the north and south of Wellsford. Table 2-1 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-1 Wellsford - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	32.71	33.04	+1.02%
Connections	868	872	+0.46%
Connections per km	26.54	26.39	-0.56%
Total EOPs	6	6	0.00%
EOPs/KM Pipe	0.18	0.18	-1.01%
Type-1 EOPs	6	6	0.00%
Type-2 EOPs	0	0	0.00%

During the reporting period, there were two WWOs and no DWOs recorded from Type-1 EOPs within the catchment and no Type-2 overflow alarms. Type-3 overflows comprised of 6 DWOs, with no associated WWOs recorded.

This catchment has performed well historically. No significant improvement works were undertaken during the reporting period, and none are planned in the immediate term.

2.2.2 Catchment 2 – Omaha

Omaha is a small beach town on Omaha Bay, north of Auckland city. The township sits approximately 75 km north of Auckland on a sandspit that adjoins Tāwharanui Peninsula. The Omaha catchment also includes the Matakana and Point Wells townships. Table 2-2 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-2 Omaha - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	63.13	63.13	0.00%
Connections	1821	1913	+5.05%

Metric	2025 Value	2026 Value	Change (%)
Connections per km	28.84	30.30	+5.05%
Total EOPs	9	9	0.00%
EOPs/KM Pipe	0.14	0.14	0.00%
Type-1 EOPs	9	9	0.00%
Type-2 EOPs	0	0	0.00%

No Type-1 or Type-2 overflows were recorded during the reporting period. Type-3 overflows comprised 6 DWOs and 1 WWO.

There were no significant improvement works completed, nor imminently planned for the network in this catchment.

2.2.3 Catchment 3 – Warkworth

The Warkworth township is on the banks of the Mahurangi River at the head of the Mahurangi Harbour. The surrounding land use comprises rural pastoral land in lowland areas and plantation and native forestry in the high country. Auckland Council has identified two indicative future urban areas in Warkworth. Table 2-3 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-3 Warkworth - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	62.33	67.00	7.48%
Connections	2349	2233	-4.94%
Connections per km	37.69	33.33	-11.56%
Total EOPs	6	6	0.00%
EOPs/KM Pipe	0.08	0.09	11.64%
Type-1 EOPs	5	5	0.00%
Type-2 EOPs	1	1	0.00%

During the reporting period, there was 1 Type-1 WWO recorded. Type-2 alarms consisted of 22 WWOs and 11 DWOs recorded, while Type-3 overflows comprised of 13 DWOs and no WWOs.

During the 2025-26 reporting year Watercare completed the Warkworth Street Pump Station and Heritage Bridge over-pumping works. These improvements increase wastewater conveyance capacity and provide interim mitigation for overflows at Elizabeth Street EOP 1540. The Warkworth Growth Servicing project remains in design to address longer-term capacity constraints and support growth.

2.2.4 Catchment 4 – Snells Beach/Algies Bay

Snells Beach and Algies Bay are adjacent settlements on the east coast of the Mahurangi Peninsula, approximately 10 km from Warkworth. Table 2-4 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-4 Snells Beach/Algies Bay - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	67.25	70.25	+4.46%
Connections	2170	2180	+0.46%
Connections per km	32.27	31.03	-3.83%
Total EOPs	10	10	0.00%
EOPs/KM Pipe	0.15	0.14	-4.27%
Type-1 EOPs	10	10	0.00%
Type-2 EOPs	0	0	0.00%

During the reporting period, there were 4 WWOs and no DWOs recorded for Type-1 EOPs within the catchment. There were no Type-2 overflow alarms recorded, and the Type-3 overflows comprised of 13 DWOs and 5 WWOs.

To support growth in the region, the newly constructed Warkworth to Snells conveyance sewer increases conveyance capacity to the Snells Beach Pump Station and Snells Wastewater Treatment Plant. This will improve the network resilience and support future demand.

2.2.5 Catchment 5 – Waiwera

Waiwera is at the southern end of the Waiwera estuary and is characterised by geothermal springs and estuarine environments. The township is surrounded by native bush, small farms, and lifestyle blocks. Table 2-5 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-5 Waiwera - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	4.17	4.17	0.00%
Connections	125	128	+2.40%
Connections per km	29.98	30.70	+2.40%
Total EOPs	3	3	0.00%
EOPs/KM Pipe	0.72	0.72	0.00%
Type-1 EOPs	3	3	0.00%
Type-2 EOPs	0	0	0.00%

Consistent with previous years, no Type-1 or Type-2 overflows were recorded during the reporting period. Type-3 overflows within the catchment comprised 1 WWO and 1 DWO.

The Waiwera Wastewater Servicing Project progressed during the 2025-26 reporting year. The project will provide a new pump station and pipeline connecting Waiwera to the Army Bay wastewater network, enabling the eventual decommissioning of the Waiwera Wastewater Treatment Plant.

2.2.6 Catchment 6 – Helensville

Helensville is on the banks of the Kaipara River at the southern end of the Kaipara Harbour. The Kaipara River catchment comprises mostly rural land uses with plantation forest, horticulture, and

lifestyle blocks. Auckland Council has identified two future urban areas north and south of the current catchment boundary. Table 2-6 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-6 Helensville - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	39.41	39.44	0.09%
Connections	1659	1673	0.84%
Connections per km	42.10	42.42	0.76%
Total EOPs	8	8	0.00%
EOPs/KM Pipe	0.20	0.20	-0.09%
Type-1 EOPs	8	8	0.00%
Type-2 EOPs	0	0	0.00%

No Type-1 or Type-2 overflows were recorded within the catchment during the reporting period. Type-3 overflows comprised of 4 DWOs and 1 WWO.

No significant improvement works were completed during the reporting period, and none are planned in the near term.

2.2.7 Catchment 7 – Orewa

Orewa is on the Hibiscus Coast, north of the Whangaparāoa Peninsula and approximately 40 km north of central Auckland. The Orewa wastewater network also serves Hatfield Beach and Silverdale North. Parts of the existing urban area are currently undeveloped and therefore not serviced by wastewater infrastructure. Furthermore, there is an extensive area of an indicative future urban area in the west of this catchment. Table 2-7 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-7 Orewa - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	223.66	233.42	+4.36%
Connections	10634	9505	-10.62%
Connections per km	47.55	40.72	-14.35%
Total EOPs	13	13	+7.69%
EOPs/KM Pipe	0.05	0.06	+11.79%
Type-1 EOPs	13	13	0.00%
Type-2 EOPs	0	0	0.00%

During the reporting period, Type-1 overflows comprised of 2 DWOs and 5 WWOs. No Type-2 overflows were recorded. Type-3 overflows comprised of 48 DWOs and 10 WWOs.

The Pohutukawa Pipeline Distribution Project was completed during the 2025-26 reporting year and is expected to improve network reliability and hydraulic performance within the catchment. The

Waiwera Wastewater Servicing Project remains in execution and will provide a new pump station and conveyance pipeline connecting Waiwera to the Army Bay wastewater network, enabling the eventual decommissioning of the Waiwera Wastewater Treatment Plant. The Silverdale West Wastewater Pump Station and Rising Main Project remains in feasibility and is planned for implementation beyond 2037 to support future growth in Silverdale West and Dairy Flat.

2.2.8 Catchment 8 – Weiti

The Weiti catchment comprises two town centres: Silverdale and Stillwater. Both Silverdale and Stillwater are on the banks of the Weiti River, with the surrounding land in rural pastoral land use, lifestyle blocks, or forestry. The Weiti Forest lies immediately south of Stillwater town. Table 2-8 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-8 Weiti - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	48.38	48.77	+0.81%
Connections	1438	1482	+3.06%
Connections per km	29.73	30.39	+2.23%
Total EOPs	10	10	0.00%
EOPs/KM Pipe	0.21	0.21	-0.81%
Type-1 EOPs	10	10	0.00%
Type-2 EOPs	0	0	0.00%

During the reporting period, Type-1 overflows comprised of 5 DWOs and 6 WWOs. No Type-2 overflows were recorded. Type-3 overflows comprised of 4 DWOs and 2 WWOs.

The Silverdale West Wastewater Rising Main Project is expected to improve network capacity and resilience while supporting future growth within the catchment.

2.2.9 Catchment 9 – Whangaparāoa

Whangaparāoa Peninsula is 25 km north of Auckland, extending east for 11 km into the Hauraki Gulf. The town of Whangaparāoa sits on the peninsula's south-western shore. Table 2-9 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-9 Whangaparaoa - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	293.60	293.23	-0.13%
Connections	12375	12163	-1.71%
Connections per km	42.15	41.48	-1.59%
Total EOPs	22	22	0.00%
EOPs/KM Pipe	0.07	0.08	+0.13%
Type-1 EOPs	21	21	0.00%
Type-2 EOPs	1	1	0.00%

During the reporting period, Type-1 overflows comprised of 2 DWOs and 5 WWOs. No Type-2 overflows were recorded. Type-3 overflows comprised of 94 DWOs and 47 WWOs.

Design of the Hobbs Bay Pumping Station Contingency Project progressed during the 2025-26 reporting year. The project is intended to improve operational resilience and reduce flood-related risks through pump station improvements and additional storage.

The Stanmore Pump Station and Rising Main Upgrade Project remains in feasibility and will provide additional wastewater capacity to support planned growth, reduce overflow risk, and address ageing infrastructure and corrosion issues. Delivery is currently planned by 2033.

The Gulf Harbour Wastewater Servicing Project remains in feasibility and is planned for implementation beyond 2037. The project will support future growth and reduce overflow risk by addressing existing network constraints serving the Gulf Harbour area.

2.2.10 Catchment 10 – Long Bay

The Long Bay catchment is on Auckland's North Shore, with the Okura River to the north and Long Bay Beach to the east. The catchment is predominantly urban, and at present, the wastewater system covers the residential suburbs and Okura. Table 2-10 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-10 Long Bay - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	78.68	79.03	+0.45%
Connections	3724	3873	+4.00%
Connections per km	47.33	49.01	+3.54%
Total EOPs	7	7	0.00%
EOPs/KM Pipe	0.09	0.09	-0.44%
Type-1 EOPs	4	4	0.00%
Type-2 EOPs	3	3	0.00%

During the reporting period, no Type-1 overflows were recorded. Type-2 overflows comprised of 1 WWO, while Type-3 overflows comprised of 23 DWOs and 4 WWOs.

The Torbay Network Upgrades Programme remains in feasibility and is intended to address multiple overflow issues across the East Coast Bays and Long Bay catchments, improving network performance and reducing overflow risk. Delivery is currently anticipated beyond 2034.

2.2.11 Catchment 11 – East Coast Bays

The East Coast Bays catchment is on Auckland's North Shore. Taiaotea Creek contains the commercial areas of Browns Bay that comprise a significant proportion of the lower catchment, with the rest of the lower catchment being residential. The upper catchment, Wairau Creek, also contains residential land use but has a significant proportion of commercial land use to the west of the Northern Motorway. Table 2-11 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-11 East Coast Bays - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	510.73	513.85	+0.61%

Metric	2025 Value	2026 Value	Change (%)
Connections	31150	31754	+1.94%
Connections per km	60.99	61.80	+1.32%
Total EOPs	33	34	+3.03%
EOPs/KM Pipe	0.06	0.07	+2.41%
Type-1 EOPs	26	26	0.00%
Type-2 EOPs	7	8	+14.29%

New EOP: Confirmed Type 2 EOP 1664 found.

During the reporting period, Type-1 overflows comprised of 3 DWOs and 12 WWOs. Type-2 overflows comprised of 2 DWOs and 18 WWOs. Type-3 overflows comprised of 278 DWOs and 99 WWOs.

Improving network performance in this catchment remains a high priority given the number of overflows reported. A range of initiatives are currently being delivered or have recently been completed to reduce overflows, increase network resilience and capacity, and improve water quality in areas valued for recreation and swimming.

The Jonathan Place Pipe Upgrades were completed during the reporting year to address recurring wastewater overflows and improve local network capacity and reliability. Design also progressed on the Mairangi Bay Gravity Sewer Upgrade, which is intended to reduce controlled and uncontrolled overflows (estimated to be completed in 2028).

Additional projects currently underway, or projects in neighbouring areas that will have an impact on this catchment, include:

- The Torbay Wastewater Network Upgrades project remains in the feasibility stage, estimated to be completed by 2035.
- Design of the Forrest Hill Wastewater Catchment Diversion project progressed during 2026
- Design of the Northcote-Chatswood Wastewater Network Upgrades project also progressed in 2026. The project is expected to be completed in 2028
- The Wairau Valley Diversion project remains in the feasibility stage and is planned for implementation beyond 2035

2.2.12 Catchment 12 – Devonport-Takapuna

The Devonport-Takapuna catchment is on Auckland's North Shore and comprises the peninsula's eastern and southern coastal strips. There are no notable surface watercourses within the catchment, and all discharges are to the marine environment. Table 2-12 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-12 Devonport-Takapuna - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	36.57	36.64	+0.18%
Connections	36.57	36.64	+0.18%
Connections per km	68.19	68.35	+0.22%
Total EOPs	7	7	0.00%

Metric	2025 Value	2026 Value	Change (%)
EOPs/KM Pipe	0.19	0.19	-0.18%
Type-1 EOPs	6	6	0.00%
Type-2 EOPs	1	1	0.00%

There was 1 Type-1 DWO and 4 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflow alarms were recorded. Type-3 overflows comprised of 14 DWOs and 2 WWOs during the reporting period.

The Wairau Pump Station Upgrade project remains in delivery and is scheduled for completion in 2035. Once completed, the project is expected to significantly reduce high-volume overflows in the area. The Forrest Hill Wastewater Catchment Diversion project remains in design and will provide additional conveyance capacity and storage to support growth and help reduce the risk of wastewater overflows to sensitive coastal receiving environments.

2.2.13 Catchment 13 – Shoal Bay

The Shoal Bay catchment is on Auckland's North Shore and is predominantly urban, with significant residential development. The Chelsea Sugar factory is a notable large industrial site within the catchment. Table 2-13 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-13 Shoal Bay - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	289.24	290.40	+0.40%
Connections	17636	17852	+1.22%
Connections per km	60.97	61.47	+0.82%
Total EOPs	35	34	-2.86%
EOPs/KM Pipe	0.12	0.12	-3.24%
Type-1 EOPs	23	23	0.00%
Type-2 EOPs	12	11	-8.33%

EOP removed: Type-2 EOP 847 decommissioned at 66 Stanley Point Road.

There was 1 Type-1 DWO and 18 Type-1 WWOs recorded in the catchment during the reporting period. Additionally, 4 Type-2 DWOs and 16 Type-2 WWOs were recorded. Type-3 overflows comprised 124 DWOs and 32 WWOs during the reporting period

The Lake Road Northcote Pump Station and Rising Main Upgrades project has been completed and is expected to reduce DWO risk and overflow frequency at EOP 830 and EOP 836. Design of the Northcote–Chatswood Wastewater Network Upgrades project also continued and will provide additional conveyance capacity and reduce controlled and uncontrolled wastewater overflows.

2.2.14 Catchment 14 – Upper Harbour North

The Upper Harbour North catchment is on Auckland's North Shore. This catchment contains a mix of urban and rural land uses, including many intensifying residential areas. There are widespread subdivisions, medium-density developments in specially zoned areas, and infill growth throughout

this catchment. Table 2-14 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-14 Upper Harbour North - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	348.03	349.25	0.35%
Connections	14814	14965	+1.02%
Connections per km	42.56	42.85	+0.67%
Total EOPs	20	20	0.00%
EOPs/KM Pipe	0.06	0.06	-0.35%
Type-1 EOPs	20	20	0.00%
Type-2 EOPs	0	0	0.00%

There were 3 Type-1 DWOs and 2 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflows were recorded. Type-3 overflows comprised 104 DWOs and 18 WWOs during the reporting period.

One of the key improvement projects in this catchment is the Unsworth Heights Diversion project, which is currently in the feasibility phase and is scheduled for completion in 2037. The project aims to alleviate capacity constraints and reduce both controlled and uncontrolled overflows.

2.2.15 Catchment 15 – Upper Harbour South

The Upper Harbour South catchment is on Auckland's North Shore. Land use within the Upper Harbour South catchment is predominantly residential, with minor commercial activities and several schools. Table 2-15 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-15 Upper Harbour South - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	226.24	227.99	+0.77%
Connections	13753	14056	+2.20%
Connections per km	60.79	61.65	+1.42%
Total EOPs	16	16	0.00%
EOPs/KM Pipe	0.07	0.07	-0.77%
Type-1 EOPs	13	13	0.00%
Type-2 EOPs	3	3	0.00%

There were 2 Type-1 WWOs recorded in the catchment during the reporting period. Additionally, 1 Type-2 DWO and 11 Type-2 WWOs were recorded. Type-3 overflows comprised 114 DWOs and 55 WWOs during the reporting period.

The Kahika Pump Station Upgrades and Rising Main Extension project is currently in the feasibility phase and is planned for completion by 2035. The project will support future growth and reduce wastewater overflows through upgrades to Kahika Pump Station and extension of the rising main to the Wairau Branch Sewer, increasing network capacity and resilience. The Beach Haven Diversion

project is also in the feasibility phase and is expected to be completed in 2034, supporting future growth and helping to reduce overflow occurrences within the catchment.

2.2.16 Catchment 16 – Upper Harbour West

The Upper Harbour West catchment is on the western side of Waitematā Harbour. Land use within the catchment is predominantly residential on the south-eastern side of Hobsonville Road and at Herald Island. The remaining area comprises lifestyle blocks and farmland on the northwest of the catchment and horticultural land use in the northeast towards Hobsonville. Parts of the existing urban area are currently not serviced, but some areas identified as a future urban area. Table 2-16 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-16 Upper Harbour West - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	184.71	195.80	+6.01%
Connections	10090	6278	-37.78%
Connections per km	54.63	32.06	-41.30%
Total EOPs	18	20	+5.56%
EOPs/KM Pipe	0.08	0.10	+19.49%
Type-1 EOPs	18	20	+11.11%
Type-2 EOPs	0	0	0.00%

New EOPs: Type-1 EOPs 1657 (Hobsonville 6 Pump Station) and 1662 (Spedding Road Pump Station) were confirmed operational during the reporting period

There were 2 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflow alarms were recorded. Type-3 overflows comprised 23 DWOs and 7 WWOs during the reporting period.

The Northern Interceptor Stage 1 project progressed towards commissioning during the reporting year 2025-26. The project will divert wastewater flows towards Rosedale WWTP, providing additional capacity for growth and supporting future overflow reductions in north-west Auckland.

Additional projects currently planned for this catchment to support future development and growth, include:

- Whenuapai and Red Hills Wastewater Servicing project, currently in the execution phase and expected to be completed in 2029.
- Northern Red Hills Wastewater Pipeline and Brigham Creek Pump Station project, currently in the feasibility phase and expected to be completed in 2037.
- Northern Interceptor Stages 3, 4 and 5, currently in the feasibility phase and expected to be completed in 2036.

2.2.17 Catchment 17 – Henderson Creek

The Henderson Creek catchment is to the west of central Auckland. The catchment contains several notable watercourses, including the Waikumete Stream and Oratia Stream, converging on the Henderson Creek. Land use within the catchment is predominantly residential, with commercial

areas. Light industrial uses concentrate in the Henderson Valley and Lincoln areas. Table 2-17 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-17 Henderson Creek - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	793.57	800.17	+0.83%
Connections	44956	46647	+3.76%
Connections per km	56.65	58.30	+2.91%
Total EOPs	17	17	0.00%
EOPs/KM Pipe	0.02	0.02	-0.82%
Type-1 EOPs	3	3	0.00%
Type-2 EOPs	14	14	0.00%

There was 1 Type-1 DWO and 8 WWOs recorded in the catchment during the reporting period. Additionally, 7 Type-2 DWOs and 89 Type-2 WWOs were recorded. Type-3 overflows comprised 255 DWOs and 120 WWOs during the reporting period.

The Redhills Pipeline B project has been completed and will provide permanent wastewater servicing capacity for future development in the catchment. The Northern Interceptor Stage 1 project progressed towards commissioning during the reporting year 2025-26. The wider Northern Interceptor programme will relieve capacity constraints and reduce overflows in the Henderson Creek catchment as subsequent stages are delivered.

2.2.18 Catchment 18 – Whau River

The Whau River catchment covers approximately 25 km² in the western part of the Auckland Isthmus. The catchment's current land use is predominantly residential, with substantial light industrial and commercial development pockets. Table 2-18 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-18 Whau River - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	367.62	371.00	+0.92%
Connections	22758	23238	+2.11%
Connections per km	61.91	62.64	+1.18%
Total EOPs	18	18	0.00%
EOPs/KM Pipe	0.05	0.05	-0.91%
Type-1 EOPs	16	16	0.00%
Type-2 EOPs	2	2	0.00%

There was 1 Type-1 DWO and 4 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflow alarms were recorded. Type-3 overflows comprised 171 DWOs and 75 WWOs during the reporting period.

The Northern Interceptor, Te Atatū North Wastewater Upgrades, Glen Eden Branch Sewer Upgrade, and Swanson Branch Sewer Upgrade projects are expected to alleviate capacity constraints within the catchment.

2.2.19 Catchment 19 – Laingholm

The Laingholm catchment is in the west of Auckland, along the northern border of the Manukau Harbour. Land use in the catchment is characterised by residential living in a bush environment, with regenerating bush in the Waitākere Ranges Regional Park bordering the catchment to the west. Table 2-19 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-19 Laingholm - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	103.74	103.80	+0.06%
Connections	3008	3014	+0.20%
Connections per km	29.00	29.04	+0.14%
Total EOPs	2	2	0.00%
EOPs/KM Pipe	0.02	0.02	-0.06%
Type-1 EOPs	2	2	0.00%
Type-2 EOPs	0	0	0.00%

There was 1 Type-1 DWO and 3 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflow alarms were recorded. Type-3 overflows comprised 36 DWOs and 6 WWOs during the reporting period.

No major works or improvement projects have taken place during the reporting period nor imminently planned for the network here.

2.2.20 Catchment 20 – Cox's Bay

The Cox's Bay catchment covers approximately 25 km² in the western part of the central Auckland Isthmus. The catchment area is highly developed, being residential, with pockets of open space dotted throughout the catchment. The bulk of wastewater network in the Cox's Bay area uses a combined stormwater-sewer system, and the catchment has a correspondingly high number of Type 2 EOPs. Table 2-20 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-20 Cox's Bay - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	98.66	99.08	+0.42%
Connections	7534	7554	+0.27%
Connections per km	76.37	76.24	-0.16%
Total EOPs	59	59	0.00%
EOPs/KM Pipe	0.60	0.60	-0.42%
Type-1 EOPs	5	5	0.00%
Type-2 EOPs	54	54	0.00%

There was 1 Type-1 DWO and 2 Type-1 WWOs recorded in the catchment during the reporting period. Additionally, 118 Type-2 DWOs and 42 Type-2 WWOs were recorded. Type-3 overflows comprised 62 DWOs and 15 WWOs during the reporting period.

- The Northern section of the Central Interceptor was commissioned in May 2026, providing additional wastewater conveyance capacity. Further improvements under the Waitematā Water Quality Improvement Programme, including the Herne Bay Branch 5 Upgrade, are progressing to reduce overflows affecting local waterways and beaches.
- The Westmere Wastewater Catchment Improvement Works project remains in the feasibility stage and is planned for implementation beyond 2037.
- The Grey Lynn Park Stage 1 & Branch 6 Collector project is currently in the design stage and is planned for implementation beyond 2037.
- The Herne Bay WW Branch 5 Upgrade project is currently in execution and is expected to be completed between 2022 and 2028.
- The Pt Chevalier Wastewater Catchment Improvement Works (CC1) project remains in the feasibility stage and is planned for implementation beyond 2037.
- The Avondale–Whau CC6 Stage 1 to PS25 Shaft project remains in the feasibility stage and is expected to be completed between 2022 and 2030.
- The Waterview Stage 2 of the Avondale Branch Sewer (CC6) project remains in the feasibility stage and is planned for implementation beyond 2037.
- The Avondale–Whau CC7A and CC7A1 to Miranda Shaft project remains in the feasibility stage and is expected to be completed between 2024 and 2029.
- The Avondale–Lynfield Branch to Haycock Shaft project remains in the feasibility stage and is planned for implementation beyond 2037.

2.2.21 Catchment 21 – Central Auckland (CBD)

The Central Auckland (CBD) catchment is approximately 9 km², extending from Westhaven Marina in the west to Mechanics Bay in the east, and bordered by the Waitematā Harbour in the north. The catchment is characterised by commercial development (low and high-rise office blocks and retail shops), cafes and restaurants, industrial activities (light, automotive), hotels, low, medium, and high-density residential living, entertainment complexes, car parks, churches, and reserve areas. The harbour edge also incorporates port, ferry, and marina activities. Significant open spaces within the catchment include the Auckland Domain, Albert Park, and Victoria Park. Table 2-21 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-21 Central Auckland (CBD) - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	113.42	113.61	+0.17%
Connections	4444	4466	+0.50%
Connections per km	39.18	39.31	+0.33%
Total EOPs	64	64	0.00%
EOPs/KM Pipe	0.56	0.56	-0.17%
Type-1 EOPs	4	4	0.00%
Type-2 EOPs	60	60	0.00%

No Type-1 overflows were recorded in the catchment during the reporting period. However, there were 62 Type-2 DWOs and 24 Type-2 WWOs. Type-3 overflows comprised 53 DWOs and 15 WWOs during the reporting period.

Construction of the Queen Street Diversion continued during the reporting year 2025-26. The project will provide additional wastewater conveyance capacity, support growth, and reduce overflow risks associated with ageing infrastructure.

2.2.22 Catchment 22 – Hobson Bay

The Hobson Bay catchment is in the central part of the Auckland Isthmus immediately to the east of the CBD. The catchment is mainly residential, with some business and industrial activity centred around Newmarket and Parnell. The wastewater network in this catchment is a mix of combined areas, separated from historically combined sewers and developed as separated areas. This mix is reflected in the number of EOPs in the catchment. Table 2-22 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-22 Hobson Bay - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	446.71	449.37	+0.60%
Connections	31632	31860	+0.72%
Connections per km	70.81	70.90	+0.12%
Total EOPs	98	97	-1.02%
EOPs/KM Pipe	0.22	0.22	-0.59%
Type-1 EOPs	19	19	0.00%
Type-2 EOPs	79	78	-1.27%

EOP Removed: Type-2 EOP 1660 decommissioned on April 2026 at 18 Cathedral place

There were 5 Type-1 WWOs, 242 Type-2 DWOs, and 148 Type-2 WWOs recorded in the catchment during the reporting period. Type-3 overflows comprised 247 DWOs and 56 WWOs during the reporting period.

The Clonburn Pipe Replacement project was completed during the reporting year 2025-26 to improve network reliability and resilience. The Newmarket Gully project remains in feasibility and is intended to provide additional wastewater storage and reduce overflows to Hobson Bay and contributing streams.

2.2.23 Catchment 23 – Onehunga

The Onehunga catchment covers approximately 23 km² on the northern shores of Māngere Inlet and the Manukau Harbour. The catchment is heavily developed, with a large business and industrial activity area along the coastal margins of Māngere Inlet and Onehunga Township. Further to the north, the catchment is mainly residential and open space zoned land. Table 2-23 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-23 Onehunga - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	269.71	272.00	+0.85%
Connections	18373	18620	+1.34%
Connections per km	68.12	68.46	+0.49%
Total EOPs	19	19	0.00%
EOPs/KM Pipe	0.07	0.07	-0.84%

Metric	2025 Value	2026 Value	Change (%)
Type-1 EOPs	18	18	0.00%
Type-2 EOPs	1	1	0.00%

There were 3 Type-1 WWOs and 1 Type-2 WWO recorded in the catchment during the reporting period. Type-3 overflows comprised 136 DWOs and 24 WWOs during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.24 Catchment 24 – Māngere

The Māngere catchment is to the south of central Auckland and contains the suburbs of Otahuhu, Māngere East, Māngere, and Māngere Bridge. Several watercourses in the area, including Tararata Creek, Harania Creek, and Tui Creek, converge in the Māngere Inlet. Land use within the catchment is mainly urban, with commercial/industrial services focused around the Māngere Inlet. Table 2-24 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-24 Māngere - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	335.94	338.73	+0.83%
Connections	13952	14493	+3.88%
Connections per km	41.53	42.79	+3.02%
Total EOPs	20	20	0.00%
EOPs/KM Pipe	0.06	0.06	-0.83%
Type-1 EOPs	15	15	0.00%
Type-2 EOPs	5	5	0.00%

There were 2 Type-1 DWOs and 4 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflows were recorded. Type-3 overflows comprised 152 DWOs and 40 WWOs during the reporting period.

The Māngere Pump Station PS86 Upgrade was completed during the reporting year 2025-26, increasing wastewater conveyance capacity and providing connectivity to the Central Interceptor. The Archboyd Avenue Pump Station and Associated Pipelines project also progressed during the reporting year to support growth and reduce overflow risks.

2.2.25 Catchment 25 – Lower Tāmaki River

The Lower Tāmaki River catchment is in the east of Auckland and covers areas around the Tāmaki River Estuary. Land use within the bay is predominantly residential, with commercial/ industrial land areas in the southwest of the catchment. There has recently been significant residential development adjacent to Mt Wellington in the former Mt Wellington quarry. Table 2-25 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-25 Lower Tāmaki River - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	319.98	324.36	+1.37%
Connections	19789	20338	+2.77%
Connections per km	61.85	62.70	+1.38%

Total EOPs	24	24	0.00%
EOPs/KM Pipe	0.08	0.07	-1.35%
Type-1 EOPs	15	15	0.00%
Type-2 EOPs	9	9	0.00%

There were 5 Type-1 WWOs and 2 Type-2 WWOs recorded in the catchment during the reporting period. Type-3 overflows comprised 171 DWOs and 42 WWOs during the reporting period.

There are several ongoing projects are planned for the catchment to support future growth and reduce both controlled and uncontrolled overflows. These include:

- Dunkirk Stage 2 Rising Main project, currently in the execution phase and expected to be completed in 2028
- PS14 Upgrade (Tāmaki) project, currently in the feasibility phase and planned for implementation beyond 2037
- Castleline Catchment Diversion to EIN project, currently in the design phase and expected to be completed by the end of 2028

2.2.26 Catchment 26 – Upper Tāmaki River

The Upper Tāmaki River catchment is in the southeast of Auckland. It is the largest geographical catchment of the Auckland wastewater network. Land use within the catchment includes large industrial/commercial land areas around Mt Wellington and Richmond and significant areas of East Tāmaki. There are also areas of the catchment which have very recently developed through expansion and growth. Table 2-26 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-26 Upper Tāmaki River - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	1162.28	1177.07	+1.27%
Connections	64052	66108	+3.21%
Connections per km	55.11	56.16	+1.91%
Total EOPs	57	57	0.00%
EOPs/KM Pipe	0.05	0.05	+2.33%
Type-1 EOPs	43	43	0.00%
Type-2 EOPs	14	14	0.00%

There were 4 Type-1 DWOs and 21 Type-1 WWOs recorded in the catchment during the reporting period. Additionally, there were 2 Type-1 DWOs and 9 Type-1 WWOs recorded during the reporting period. Type-3 overflows comprised 491 DWOs and 100 and 48 WWOs during the reporting period.

The Ōtara Catchment Wastewater Capacity Upgrades project continued during the reporting year 2025-26. The project will increase wastewater storage and pumping capacity, support growth, and reduce overflows associated with network capacity constraints.

2.2.27 Catchment 27 – Cockle Bay

The Cockle Bay catchment is along the eastern coast of the Bucklands Beach peninsula. Land use is predominantly low to medium density residential, with pockets of open space and local retail and

commercial areas. There are no industrial sites within the catchment. Table 2-27 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-27 Cockle Bay - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	106.97	107.19	+0.21%
Connections	5050	5066	+0.32%
Connections per km	47.21	47.26	+0.11%
Total EOPs	7	7	0.00%
EOPs/KM Pipe	0.07	0.07	-0.21%
Type-1 EOPs	7	7	0.00%
Type-2 EOPs	0	0	0.00%

There were 2 Type-1 WWOs recorded from this catchment during the reporting period. There were 2 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflows were recorded. Additionally, Type-3 overflows comprised 35 DWOs and 18 WWOs during the reporting period. Type-3 overflows comprised 35 DWOs and 18 WWOs during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.28 Catchment 28 – Puhinui

The Puhinui catchment is about 18 km southeast of Auckland city centre, to the northeast of Manukau Harbour. The catchment consists predominantly of residential, industrial, and commercial land uses, with some land in horticulture. The Auckland Airport is to the west of the catchment, on the northern side of the Manukau Harbour. Table 2-28 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-28 Puhinui - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	405.56	409.15	+0.88%
Connections	20106	20535	+2.13%
Connections per km	49.58	50.19	+1.24%
Total EOPs	13	13	0.00%
EOPs/KM Pipe	0.03	0.03	-7.96%
Type-1 EOPs	11	11	0.00%
Type-2 EOPs	2	2	0.00%

No Type-1 overflows were recorded while 2 Type-2 WWOs and 1 Type-2 WWO were recorded from this catchment during the reporting period. Additionally, Type-3 overflows comprised of 132 DWOs during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.29 Catchment 29 – Pahurehure Inlet

The Pahurehure Inlet catchment is in south Auckland, with commercial areas in Manurewa and Papakura and a large industrial/commercial zone in Takanini. Substantial growth is expected in this

region. Table 2-29 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-29 Pahurehure Inlet - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	725.27	741.67	+2.26%
Connections	15523	15819	+1.91%
Connections per km	21.40	21.33	-0.35%
Total EOPs	22	22	0.00%
EOPs/KM Pipe	0.03	0.03	+7.57%
Type-1 EOPs	15	15	0.00%
Type-2 EOPs	7	7	0.00%

There were 4 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflows were recorded. Type-3 overflows comprised 145 DWOs and 35 WWOs during the reporting period.

To support growth in the region, accommodate new developments, and divert flows away from the constrained Southern Interceptor, the Southern Auckland Wastewater Servicing Scheme is currently in the design phase and is scheduled for completion in 2030.

2.2.30 Catchment 30 – Oneroa

Waiheke Island is in the Hauraki Gulf, approximately 17 km east of the Auckland CBD. Only a small proportion of the island, comprising Oneroa, Blackpool, and part of Surfdale, is currently serviced. Table 2-30 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-30 Oneroa - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	3.08	3.08	-0.06%
Connections	38	39	+2.63%
Connections per km	12.34	12.67	+2.64%
Total EOPs	1	1	0.00%
EOPs/KM Pipe	0.32	0.32	+0.01%
Type-1 EOPs	1	1	0.00%
Type-2 EOPs	0	0	0.00%

Consistent with previous years, there were no controlled or uncontrolled network overflows recorded from this catchment during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.31 Catchment 31 – Beachlands-Maraetai

The Beachlands-Maraetai catchment includes two seaside suburbs located about 23 km east of central Auckland. Land use within the catchment is predominantly residential. Beachlands has marina facilities at Pine Harbour Marina, and Maraetai has a small boat ramp and breakwater. Table 2-31 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-31 Beachlands-Maraetai - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	111.31	114.01	+2.43%
Connections	3474	3949	+13.67%
Connections per km	31.21	34.64	+10.98%
Total EOPs	11	11	0.00%
EOPs/KM Pipe	0.10	0.10	-2.37%
Type-1 EOPs	11	11	0.0%
Type-2 EOPs	0	0	0.00%

There were 12 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflows were recorded. Type-3 overflows comprised 15 DWOs and 5 WWOs during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.32 Catchment 32 – Clarks Beach

Clarks Beach is a small coastal village located on the south-western shore of the Manukau Harbour between the Waiuku River and Clarks Creek. Land use includes residential properties, the Clarks Beach Golf Club, Clarks Beach Camping Ground, and surrounding rural activities. Table 2-32 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-32 Clarks Beach - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	32.01	33.30	+4.03%
Connections	840	784	-6.67%
Connections per km	26.25	23.55	-10.28%
Total EOPs	13	13	0.00%
EOPs/KM Pipe	0.41	0.39	-3.88%
Type-1 EOPs	12	12	0.00%
Type-2 EOPs	1	1	0.00%

No Type-1 or Type-2 overflows were recorded in the catchment during the reporting period. However, Type-3 overflows comprised 14 DWOs and 1 WWO during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.33 Catchment 33 – Waiuku

Waiuku Township is at the southern end of the Waiuku Estuary, a tidal arm of the Manukau Harbour. The Waiuku Catchment is 420 ha of predominantly residential and rural land, with some light commercial land. The catchment has one golf course, eight parks of significant size, and several schools. Table 2-33 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-33 Waiuku - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	70.31	70.90	+0.84%
Connections	2913	2937	+0.82%
Connections per km	41.43	41.42	-0.02%
Total EOPs	12	12	0.00%
EOPs/KM Pipe	0.17	0.17	-0.84%
Type-1 EOPs	12	12	0.00%
Type-2 EOPs	0	0	0.00%

No Type-1 or Type-2 overflows were recorded in the catchment during the reporting period. However, Type-3 overflows comprised 9 DWOs and 4 WWOs during the reporting period.

There were no significant improvement works completed, nor imminently planned for the network here.

2.2.34 Catchment 34 – Pukekohe

The Pukekohe catchment is on the southern edge of the Auckland Region, approximately 50 km south of central Auckland. The catchment comprises the Pukekohe urban area, Patumahoe Township and the Paerata Business Park to the north, and Buckland and Tuakau townships to the south. Table 2-34 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-34 Pukekohe - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	233.61	235.72	+0.91%
Connections	9155	8172	-10.74%
Connections per km	39.19	34.67	-11.54%
Total EOPs	19	20	+5.26%
EOPs/KM Pipe	0.08	0.08	+4.32%
Type-1 EOPs	19	20	+5.26%
Type-2 EOPs	0	0	+0.00%

New EOP: Type-1 EOP 1661 (Nanjing Pump Station) confirmed operational in April 2026.

There were 4 Type-1 DWOs and 6 Type-1 WWOs recorded in the catchment during the reporting period. No Type-2 overflow alarms were recorded. Type-3 overflows comprised 42 DWOs and 20 WWOs during the reporting period.

Work continued on the Pukekohe Trunk Sewer–Isabella Pump Station and Jutland Pump Station Diversion projects during the reporting year 2025-26. The Paerata Wastewater Servicing project is also at the design stage and is expected to be completed in 2033. These improvements will increase conveyance capacity, address downstream constraints, and support planned growth.

2.2.35 Catchment 35 – Kumeū-Huapai-Riverhead

The Kumeū-Huapai-Riverhead catchment covers approximately 1,270 ha in rural northwest Auckland. There are no existing EOPs in the catchment. However, Watercare has plans for engineered overflow points to cater for future growth identified in the Auckland Plan and proposed

Auckland Unitary Plan. Table 2-35 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-35 Kumeū-Huapai-Riverhead - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	81.44	82.57	+1.38%
Connections	3230	3160	-2.17%
Connections per km	39.66	38.27	-3.50%
Total EOPs	0	0	0.00%
EOPs/KM Pipe	0.00	0.00	0.00%
Type-1 EOPs	0	0	0.00%
Type-2 EOPs	0	0	0.00%

As there are no EOPs in this catchment, no Type-1 or Type-2 overflows were recorded during the reporting period. However, Type-3 overflows comprised 1 DWO and no WWOs during the reporting period.

Northern Interceptor Stage 1 progressed towards commissioning during the reporting year 2025-26. Once operational, the project will divert wastewater flows towards the Rosedale WWTP and provide additional conveyance capacity to support growth in north-west Auckland

2.2.36 Catchment 36 – Western Isthmus

The Western Isthmus catchment is to the west of central Auckland, with predominantly residential land use. The Central Interceptor, including the additional extension and collector sewers have become operational and additional works are underway to improve performance of the wastewater network here. Table 2-36 compares core network metrics for 2025 and 2026 and highlights changes over the past year.

Table 2-36 Western Isthmus - Network metrics: year-on-year comparison

Metric	2025 Value	2026 Value	Change (%)
Pipe Length (km)	640.38	649.50	+1.42%
Connections	45795	46571	+1.69%
Connections per km	71.51	71.70	+0.27%
Total EOPs	120	116	-3.33%
EOPs/KM Pipe	0.19	0.18	-3.89%
Type-1 EOPs	11	11	0.00%
Type-2 EOPs	109	106	-2.75%

Changes to EOP configuration during the reporting period included:

- Type-2 EOPs 739 and 725 were decommissioned and replaced by Type-1 EOP 1560, which is now operational.
- Type-2 EOP 726 was decommissioned and replaced by Type-1 EOP 1552, which is now operational.
- Type-2 EOPs 728 and 727 were decommissioned and replaced by Type-1 EOP 1553, which is now operational.

- Type-2 EOPs 724, 723 and 342 were decommissioned and replaced by Type-1 EOP 1561, which is now operational.
- Type-2 EOP 1558 was confirmed operational during the reporting period

There were 3 Type-1 DWOs and 2 Type-1 WWOs recorded in the catchment during the reporting period. Additionally, 107 Type-2 DWOs and 51 Type-2 WWOs were recorded. Type-3 overflows comprised 283 DWOs and 98 WWOs during the reporting period.

The Northern section of the Central Interceptor was commissioned in May 2026, completing the main tunnel and increasing wastewater conveyance capacity. Further works under the Waitematā Water Quality Improvement Programme, including the Herne Bay Branch 5 Upgrade and other catchment improvements, will progressively extend the benefits of the Central Interceptor.

3 DRY WEATHER OVERFLOWS

3.1 Introduction

This section analyses DWOs across the NDC catchments for the 2025–2026 reporting year. Results are presented separately for Type-1, Type-2, and Type-3 events, with both annual outcomes and longer-term trend insights. Comprehensive event lists for the reporting year are provided in 0.

The NDC does not set performance targets for DWO frequency. Nevertheless, systematic analysis, particularly of Type-3 events supports evidence-based decisions on network flushing, preventative maintenance, asset renewals, repeat engineer-led investigations, and targeted community education on wastewater stewardship. Comparisons with historical DWO frequencies provide a view of performance over time; these trends are examined further in Section 3.4.

Dry weather overflows 2025-2026

Table 3-1 summarises the DWOs that occurred during the 2025-26 reporting period. Compared with 2024-25, Type-1 (pump station) overflows increased from 6 to 35 events, while Type-2 EOP overflows decreased slightly from 574 to 559 events. Type-3 DWOs decreased from 3,605 to 3,341 events, representing a reduction of 264 overflows (7.3%). The increase in Type-1 overflows was primarily attributable to blockage-related events, with 28 of the 35 incidents recorded as blockages of unknown origin. The continued reduction in Type-2 and Type-3 overflows reflects ongoing operational management, targeted maintenance activities and improvements in network performance.

As in previous years, customer-driven blockages continued to account for a significant proportion of Type-3 DWOs. Root intrusion remained the most frequently recorded identified cause, increasing from 712 to 783 events, while overflows attributed to fats, oils and grease (FOG) increased from 645 to 680 events. Rubbish-related overflows also increased from 58 to 145 events. Reductions were observed across several other Type-3 overflow causes. Overflows attributed to broken pipes decreased from 255 events in 2024-25 to 0 in 2025-26[1] while incidents associated with rags and wet wipes reduced from 334 to 134 events. Smaller reductions were also observed for silt (83 to 61), foreign objects (60 to 59), and power failures (9 to 6). These reductions contributed to the overall decrease in Type-3 DWOs during the reporting period.

Changes in the recording and classification of overflow causes also influenced the year-on-year distribution of Type-3 DWOs. During the 2025-26 reporting period, a new blockage of unknown origin category was introduced and accounted for 982 incidents. This classification is applied where available records indicate that a blockage or obstruction occurred, but insufficient information exists to determine the specific blockage source. In contrast, the unknown category is reserved for incidents where the cause cannot be determined from the available records and there is insufficient evidence to indicate that a blockage was involved. As a result, incidents recorded as unknown

[1] For FY2026, 95 Type-3 DWO events associated with broken pipes were incorporated into the 'Unknown' category to maintain consistent classification and reporting across multiple reporting standards.

decreased substantially from 1,448 to 491 events, reflecting improved cause classification and providing a more accurate representation of blockage-related overflows across the network.

Variability in network conditions, together with ongoing improvements in cause recording practices, are likely to have influenced the observed trends. Continued public education regarding the appropriate disposal of fats, oils and grease (FOG) and non-flushable materials, together with targeted maintenance, blockage prevention programmes and improved cause identification, will support further reductions in dry weather overflows across the network.

Table 3-1 Comparison of causes of DWOs between 2024-25 and 2025-26

	Type-1		Type-2		Type-3	
Cause	**2024-25**	**2025-26**	**2024-25**	**2025-2026**	**2024-25**	**2025-26**
Broken pipe	0	0	Not Recorded	0	255	0
Fats	0	0		0	645	680
Foreign objects	0	0		0	60	59
Rags/ wet wipes	0	0		0	334	134
Roots	0	0		0	712	783
Rubbish	0	0		0	58	145
Silt	0	0		0	83	61

Unknown	3	2		0	1,448	491
Power failure	2	2		0	9	6
Mechanical	1	3		0	0	0
Cross connection	0	0		0	1	0
Total overflows	**6**	**35**	**574**	**559**	**3,605**	**3,341**

3.1.1 Type-1 overflows

Telemetry devices monitor imminent and actual overflows at all 422 Watercare pump stations and storage tanks (Type-1 EOPs). When a DWO alarm is received, staff attend the site to confirm the alarm, undertake remedial works, and complete any required clean-up.

During the 2025-26 reporting period, a total of 35 DWOs were recorded from Type-1 EOPs. This compared with the 6 incidents recorded during the 2024-25 reporting period, shows an increase of 29 incidents. Overflows occurred across multiple pump stations throughout the network, with Table 3-2 summarising those sites that recorded more than one overflow event during the reporting period.

Majority of Type-1 DWOs for the 2025-26 reporting year were attributed to blockages of unknown origin, accounting for 28 incidents (80% of all Type-1 DWOs). The remaining incidents comprised 3 overflows caused by mechanical failure, 2 overflows being attributed to power failure and, 2 overflows recorded as being of unknown causes. The predominance of blockages of unknown origin highlights the ongoing challenge of determining the precise cause of some overflow events following

site attendance, particularly where evidence of a blockage has partially or fully cleared before investigation.

Table 3-2 shows that 6 pump stations recorded multiple overflow events during the 2025-26 reporting period. Cape Hill Road Pump Station (Pukekohe), Weiti Pump Station, and PS 5 Oliver Road Pump Station (Western Isthmus) each recorded 3 overflows, while Foundry Pump Station (Weiti), Castor Bay Pump Station (East Coast Bays), and Florence Pump Station (Orewa) each recorded 2. Blockages of unknown origin were identified as the cause of all overflows, except for 1 of the 3 incidents at Cape Hill Road Pump Station, which was recorded as having an unknown cause.

The totals for pump station overflows at sites that experienced more than one overflow event are presented in Table 3-2, and event-level details for all Type-1 DWOs are provided in Appendix D.

Table 3-2 Summarising cause and number of overflows from Type-1 DWO EOPs

Catchment	Facility Name	EOP ID	Cause	Overflow by different Cause	No. of Overflows
Pukekohe	Cape Hill Road Pump Station	1,247	Unknown	1	3
			Blockage of Unknown Origin[2]	2	
Weiti	Weiti Pump Station	822	Blockage of Unknown Origin		3
Weiti	Foundry Pump Station	801	Blockage of Unknown Origin		2
Western Isthmus	PS 5 Oliver Road	701	Blockage of Unknow Origin		3
East Coast Bays	Castor Bay Pump Station	871	Blockage of Unknown Origin		2
Orewa	Florence Pump Station	1,262	Blockage of Unknown Origin		2

3.1.2 Type-2 overflows

Type 2 overflows occur from EOPs distributed across both the local and transmission wastewater networks. Out of 383 Type-2 EOPs, 95 have telemetry devices installed to alert and record potential overflow events. These telemetered alarms are used in this report as indicators of performance. However, the dataset does not represent the full network and has not been validated or cause-assigned.

As per reporting methodology, all alarms recorded following 10 mm or less of rainfall in the preceding 24 hours are classified as DWOs, even when surcharge may have been a factor. A small

[2] An unknown cause means that staff responded to the overflow alarm and confirmed that an overflow occurred but were unable to identify the exact cause. This may have been due to network surcharging caused by rainfall less than 10 mm, which would classify it as a DWO rather than a WWO.

proportion of false positives is also expected. While this limits reliability for absolute counts, the dataset remains useful for identifying poorly performing EOPs and prioritising follow-up.

During the 2025-26 reporting period 559 Type-2 DWO alarms were recorded across 50 EOP sites, compared with 574 in 2024-25, a net decrease of 15 overflows (-2.6%). The most affected catchments during 2025-26 were:

- Hobson Bay: 242 alarms
- Coxs Bay: 118 alarms
- Western Isthmus (Central Interceptor): 107 alarms
- Central Auckland (CBD): 62 alarms

The highest number of alarms were concentrated at the following EOPs:

- EOP 734 — Morning Star Place, Sandringham: 55 DWOs
- EOP 180 — Hackett Street, St Marys Bay: 55 DWOs
- EOP 201 — Intersection of Sarsfield and Lawrence Streets, Herne Bay: 54 DWOs
- EOP 740 — Argyle Street, Herne Bay: 46 DWOs
- EOP 728 — Haverstock Road, Sandringham: 44 DWOs
- EOP 420 — Nuffield/Mahuru Streets, Newmarket: 38 DWOs
- EOP 505 — Scherff Road, Remuera: 36 DWOs

Interpretation and Limitations

- Many of the highest-alarm EOPs are on combined network corridors, such as the Central Auckland CBD, Western Isthmus branches, and Hobson Bay. In these areas, small rainfall totals can still trigger surcharge, which explains the concentration of DWO alarms despite the ≤10 mm dry-weather screen.
- The alarm counts are derived from telemetry records only and not validated against actual overflow events. Nonetheless, the pattern of alarms is a practical indicator of areas requiring investigation and maintenance, with Hobson Bay, Cox's Bay and Western Isthmus standing out as priority catchments similar to the 2024-25 reporting year as seen in Figure 3-1.

Planned Improvement

- The Central Interceptor is set to substantially reduce overflows from combined systems, including EOPs in the Western Isthmus, Central Auckland CBD, and Hobson Bay catchments, covering sites such as EOP 734 and EOP 180. The Herne Bay Branch 5 Upgrade Project (scheduled for completion in 2027) aims to specifically address frequent overflows in the Herne Bay area, covering sites such as EOP 201. Further details on these and other network improvements are provided in Section 6 of this report.

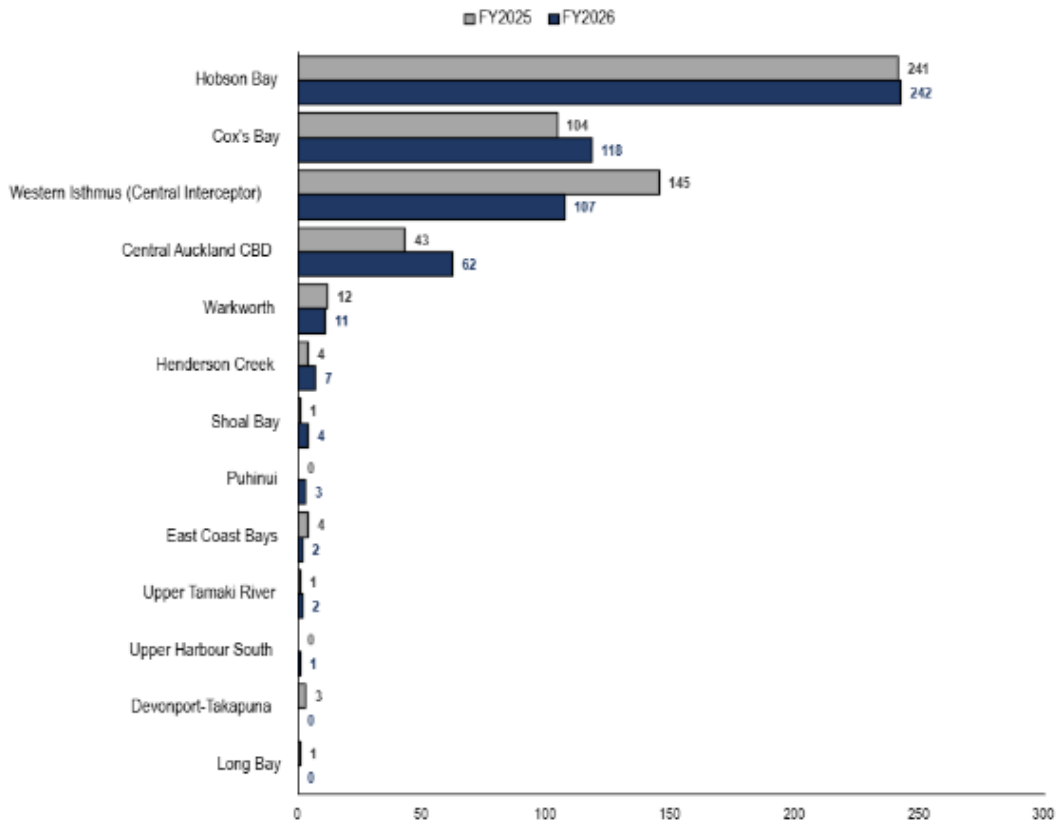

Figure 3-1: Total Type-2 EOP DWO alarms by catchment for the reporting period 2025-26

The high number of Type-2 DWO alarms does not directly indicate multiple blockages along the network. These EOPs are designed to spill in wet weather, and many of the recorded alarms this year are still likely attributable to network surcharging during low to moderate rainfall rather than dry-weather blockages. Actions to further improve wet-weather performance at those EOPs contributing the highest overflow volumes are summarised in Table 4-4 of Section 4.2.

Comparison of overflow alarm frequencies for the 2025-26 data with the 2024-25 dataset provides insights into year-on-year network behaviour and is outlined in Figure 3-2. Figure 3-2 shows that changes were not evenly distributed across the network, with a small number of EOPs accounting for most of the increase and decrease in alarm frequency. The largest increases were recorded at EOP 201 (Cox's Bay; +14 alarms), EOP 734 (Western Isthmus - Central Interceptor; +14 alarms), EOPs 511 and 213 (Hobson Bay; +7 alarms each), EOP 202 (Cox's Bay; +7 alarms), and EOP 728 (Western Isthmus – Central Interceptor; +6 alarms). Conversely, substantial reductions were observed at EOP 727 (Western Isthmus – Central Interceptor; -37 alarms), EOP 712 (Central Auckland CBD; -36 alarms), EOP 420 (Hobson Bay; -17 alarms) and EOP 739 (Western Isthmus - Central Interceptor; -13).

Overall, the results indicate a modest network-wide improvement compared with the previous reporting period. While several locations exhibited step-change increases that warrant further investigation, the largest year-on-year changes were reductions, suggesting that targeted operational and maintenance interventions at key sites show promising improvements. Continued focus should be placed on understanding the causes of increasing alarm frequencies at emerging

hotspot locations and sustaining improvements at sites that have demonstrated significant reductions.

The comparison from this reporting year shows both improvements and emerging risks at the EOP level:

Improvements

Type-2 DWO records show sustained reductions across the 3 sites presented in Figure 3-3. Annual event counts for the period from 2021-22 to 2025-26 are provided below, with years in which no events were recorded shown as zero:

- EOP 712 (Central Auckland CBD): 42 → 66 → 61 → 36 → 0
- EOP 739 (Western Isthmus - Central Interceptor): 34 → 56 → 31 → 13 → 0
- EOP 188 (Lower Tāmaki River): 18 → 26 → 15 → 0 → 0
- EOP 727 (Western Isthmus - Central Interceptor): 0 → 0 → 0 → 38 → 0

These results indicate that the reductions recorded in recent reporting years have been maintained, with no DWOs recorded at these sites during the 2025-26 reporting year. Notably, EOP 727 (Western Isthmus) identified as an emerging risks site in 2024-25 and recorded 38 DWOs respectively in the previous reporting year but no DWOs in 2025-26. This improvement may reflect the benefits of the Central Interceptor Stage 1 commissioning, although further reporting in 2026-27 and beyond will be required to confirm a sustained reduction.

Emerging and continuing risks

The following sites recorded elevated DWO frequencies during the reporting period or have shown more variable performance across recent reporting years:

- EOP 740 (Cox's Bay): 0 → 0 → 0 → 47 → 46
- EOP 201 (Cox's Bay): 0 → 61→ 59 → 40 → 54
- EOP 180 (Central Auckland CBD): 40 → 0 → 0 → 0 → 55

This reporting year continued to show mixed results, with several sites maintaining the reductions achieved in previous years, while others recorded elevated DWO frequencies. Consistent with previous reporting periods, incidents were concentrated within a small number of catchments, particularly Cox's Bay, indicating that network performance continues to be influenced by a limited number of hotspot locations rather than being evenly distributed across the network. Detailed trend analysis is provided in Section 3.3 below.

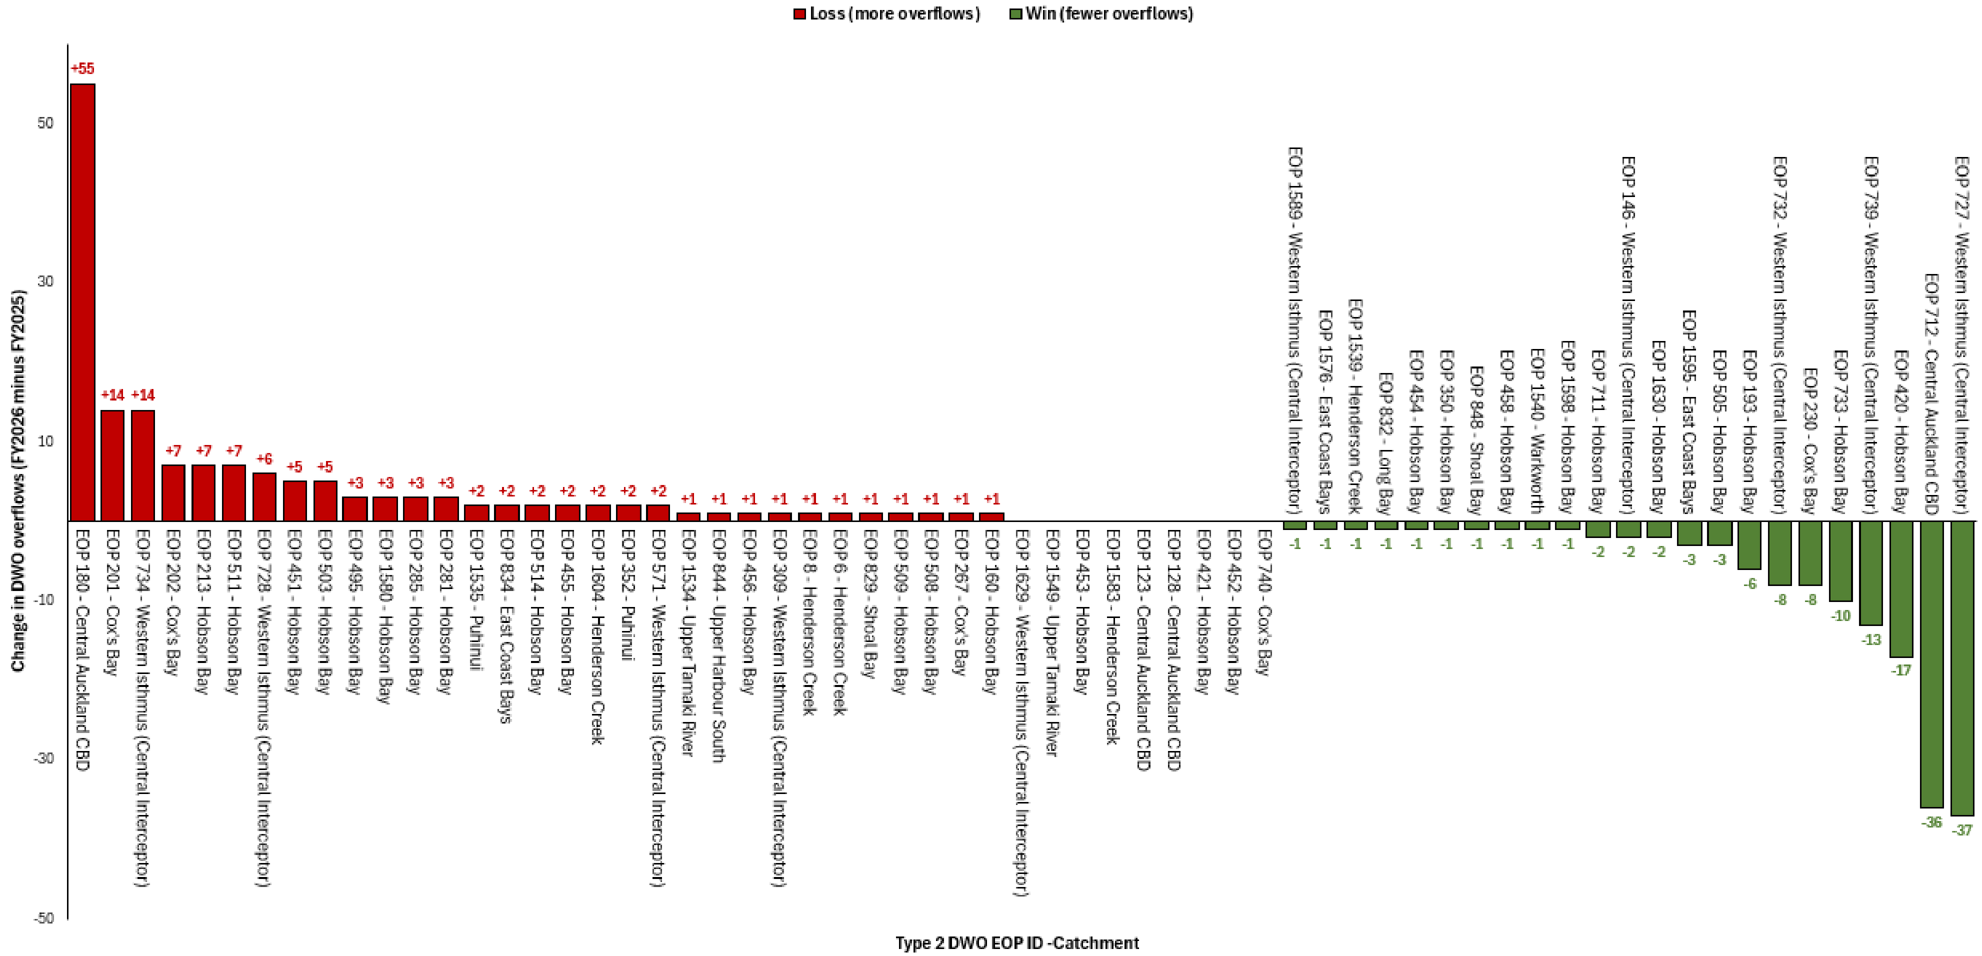

Figure 3-2: Comparison of Type-2 DWO overflow alarms for EOPs recorded in FY2026 against the FY2025 frequencies

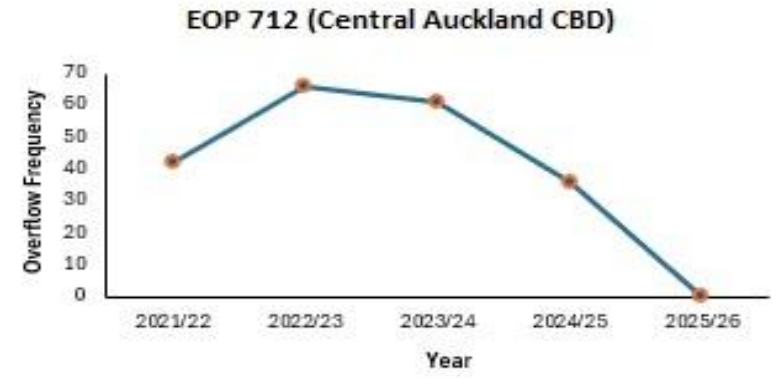
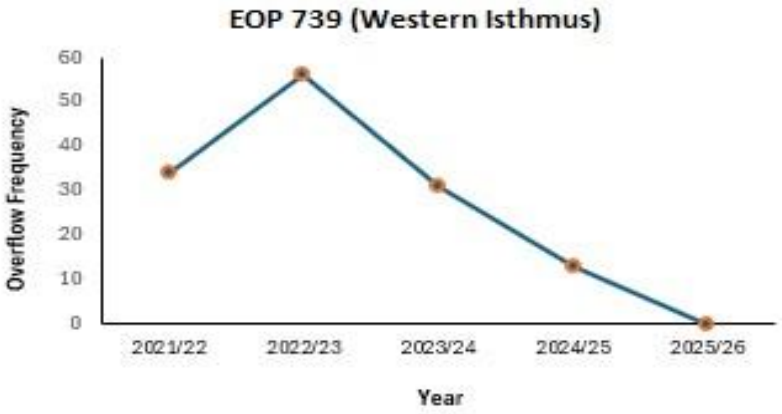
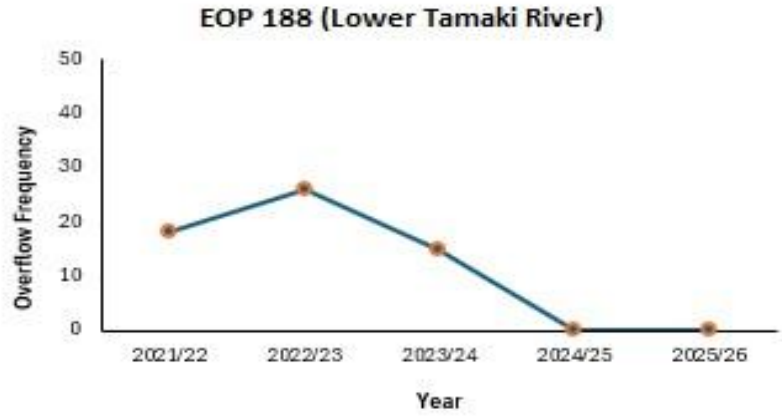


Year	Overflows
2021/22	42
2022/23	66
2023/24	61
2024/25	36
2025/26	0



Year	Overflows
2021/22	34
2022/23	56
2023/24	31
2024/25	13
2025/26	0



Year	Overflows
2021/22	18
2022/23	26
2023/24	15
2024/25	0
2025/26	0

Figure 3-3: Type 2 DWOs – top three EOPs with decreasing trends between 2021-2026

3.1.3 Type-3 overflows

Type 3 overflows account for all reported uncontrolled spills onto private and public property from the public network. Overflows typically emerge from gully traps and manholes but can also be traced to broken or faulty pipes. The Type-3 data presented in this Section, and in Section 4 (Type-3 WWOs), comprise the reported and attended uncontrolled overflows from the public, gravity-fed wastewater network (i.e., the Watercare network). This dataset excludes callouts later confirmed as private property issues.

In 2025-26, a total of 3,341 Type-3 DWOs were recorded, which is a notable decrease from the 3605 Type-3 DWOs recorded in the 2024-25 reporting year (8.0% decrease)[3]. Of the Type-3 DWOs recorded, 3299 occurred in the local network and 42 occurred in the transmission network (noting that there was only a total of 7 transmission sites that had repeated overflows which can be found in Appendix D). This highlights that majority of uncontrolled overflows continue to originate within the local reticulation network. Figure 3-4 presents a catchment-wide comparison of DWO occurrences with those recorded in the previous reporting year.

Differences in incident levels[4]

Of the total DWOs reported:

- 3,225 incidents (96.6%) were recorded as Level 1 (contained on private land or limited impact to the environment)
- 90 incidents (2.6%) were designated Level 2[5] pollution events
- 25 (0.7%) were escalated to Level 3[6] pollution incidents
- 1 severe Level 4[7] incident was reported

Compared with the 2024-25 reporting year, the distribution of incident severity shows a continued improvement, with Level 1 incidents decreasing from 3,331 (3,356 with third party damage) to 3,226, Level 2 incidents from 217 (218 with third party damage) to 89, and Level 3 incidents from 56 to 25, while Level 4 incidents remained unchanged at one.

[3] The cause category "third party damage" was excluded from the current and previous reporting year counts to maintain consistency in reporting methodologies for this year's report. Including third party damage events, the total number of Type-3 DWOs recorded in 2025-26 was 3357 (16 third party damages). Including third party damage events the total number of Type-3 WWOs recorded in 2025-26 was 1039 (2 third party damages).

[4] For data cleaning and consistency, overflow records for Type-3 DWO and WWO that did not specify an incident level (Levels 1, 2, 3, or 4) were assigned an incident level of 2 where the receiving environment was a waterbody.

[5] Level 2 (Minor Overflow): Routine-scale event involving limited impacts, such as discharge to a watercourse with natural dilution, low downstream ammonia (<3 ppm), minor ecological or property effects, and a small, localised health risk (≤2 households or <10 people).

[6] Level 3 (Significant Overflow): Event requiring escalation due to higher impacts, including obvious contamination, stressed or impacted ecology, elevated ammonia (>3 ppm), short-duration high-volume or longer low-volume discharge to sensitive areas, and health risks affecting multiple households or >10 people.

[7] Level 4 (Major Overflow): High-impact event involving prolonged or high-volume discharge with no effective containment, anoxic or black waterways, definite ecological harm (fish/wildlife deaths), significant public health risk (>10 households or >100 people), and property damage >$10,000.

Causes of overflows

As in previous years, a substantial proportion of DWOs were unable to be attributed to a specific cause. During the 2025-26 reporting period, 491 Type 3 DWOs, representing 14.7% of the total, were reported under the "Unknown" category, this count includes 396 incidents originally classified as 'unknown' and 95 incidents classified as 'broken pipe'[8]. A further 982 incidents, representing 29.4%, were classified as Blockage of Unknown Origin. These classifications reflect the inherent difficulty in accurately determining the root cause of a blockage once the overflow has been resolved and normal service restored. The "unknown blockage" category was introduced during the 2025-26 reporting period and was assigned where records indicated the presence of a blockage or obstruction, but insufficient information was available to determine the underlying cause. In contrast, 'unknown' cause was used only where the cause of the overflow could not be determined from the available information. For overflows where a cause was determined:

- Root intrusion remained the leading contributor, responsible for 783 overflows (~23.4% of all DWOs, and 41.9% of known causes)
- FOG blockages followed closely, accounting for 680 incidents (~20.4% of all DWOs, 36.4% of known causes)
- Other reported causes included rubbish (145), rags (134), silts (61), and smaller numbers from foreign objects (59), and isolated issues such as power/mechanical failure (6)

Geographic distribution

Just over half of all Type-3 DWOs were concentrated in seven catchments (seen in Table 3-3):

- Upper Tāmaki River – 490 overflows
- Western Isthmus – 282 overflows
- East Coast Bays – 277 overflows
- Henderson Creek – 253 overflows
- Hobson Bay – 245 overflows
- Whau River – 170 overflows
- Lower Tamaki River – 170 overflows

Consistent to the last reporting year, Upper Tāmaki River catchment remains the poorest performer across Auckland. FOG-related blockages remained as the leading cause of overflows in this catchment. Public education campaigns, including targeted outreach and social media initiatives, continue to raise awareness about safe disposal of fats, oil, and grease.

Network density assessment

To normalise impacts across different catchment sizes, the number of Type 3 DWOs per kilometre of local pipeline has been assessed. See Figure 3-4 for the full illustration.

- Overall density improved year-on-year, consistent with the reduction in total Type-3 DWOs (3,605 → 3,341; -7.3%).

[8] For 2026-25 only, the cause 'broken pipes' have been included in the 'Unknown' category tally for Type 3 WWO and DWO overflows to maintain consistency in reporting methodologies.

- Highest density catchments (indicative hotspots): Cox's Bay (0.63), Hobson Bay (0.55), East Coast Bays (0.54), Lower Tāmaki River (0.52), and Upper Harbour South (0.50). These are predominantly urban catchments consistent with higher load/complexity
- Lowest density catchments: Oneroa (0.00), Kumeū/Huapai/Riverhead (0.01), HBC-Weiti (0.08), Helensville (0.10), and Ōmaha (0.10).
- Notable density improvements: Wellsford 0.52 → 0.18; Shoal Bay 0.66 → 0.43; Central Auckland CBD 0.61 → 0.47; Upper Harbour South 0.66 → 0.50.
- Notable density increases: Clarks Beach 0.25 → 0.42; Māngere 0.32 → 0.43; Cockle Bay 0.21 → 0.33; Upper Tāmaki River 0.38 → 0.42; HBC-Orewa 0.17 → 0.20.

Table 3-3 Comparison of total number of Type-3 DWOs per catchment during current (2025-26) and previous reporting periods (2024-2025)

Catchment	FY2026	FY2025	YoY Change	YoY %
Upper Tamaki River	490	435	+55	+12.6%

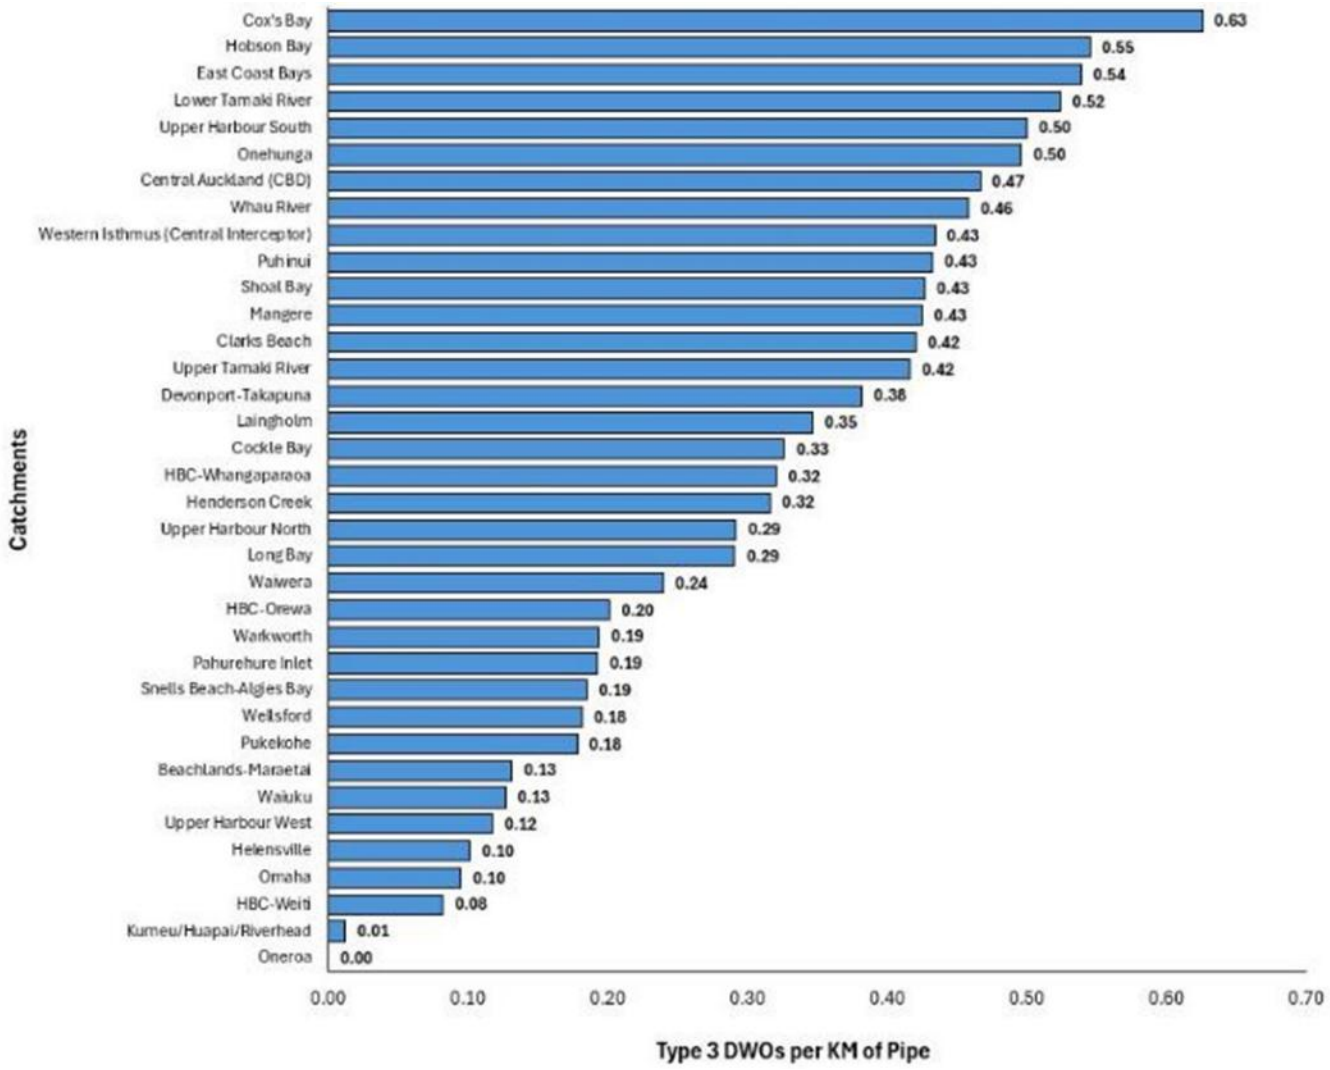

Figure 3-4: Number of Type-3 DWOs per 1 km of wastewater network pipe per catchment in 2025-26

Repeat DWOs

A repeat DWO is one that occurs twice or more within 12 months and may indicate a systemic network issue (Table 3-4). The catchments with the highest number of repeat Type-3 DWO sites were Upper Tāmaki River with 137 sites, followed by Western Isthmus (Central Interceptor) and Hobson Bay with 67 sites each, Henderson Creek with 53 sites and East Coast Bays with 51 sites during the reporting period. Table 3-4 summarises the number of repeat overflow sites and the number of engineer-led investigations per catchment. Western Isthmus (Central Interceptor) also recorded the highest number of engineer-led investigations undertaken during the reporting period (45), followed by Hobson Bay (31), Upper Tāmaki River (27), Lower Tāmaki River (21) and Onehunga (20).

Table 3-4 Summarising number of repeat Type-3 DWOs and engineer-led investigations per catchment for the reporting period 2025-26

Catchment	No. of Repeat Overflow Sites per Catchment	No. of Engineer-led Investigations
Central Auckland CBD	17	9
Upper Tamaki River	137	27
Western Isthmus (Central Interceptor)	67	45
Hobson Bay	67	31
East Coast Bays	51	6
Henderson Creek	53	5
Puhinui	42	8
Whau River	36	12
Mangere	27	8
Pahurehure Inlet	35	12
Onehunga	34	20
Lower Tamaki River	30	21
Shoal Bay	26	9
Upper Harbour South	9	9
Whangaparaoa	24	4
Cox's Bay	16	12
Upper Harbour North	16	3
Pukekohe	8	0
Long Bay	7	1
Upper Harbour West	6	1
Beachlands Maraetai	2	1
Cockle Bay	5	2
Warkworth	4	2
Laingholm	3	1

Catchment	No. of Repeat Overflow Sites per Catchment	No. of Engineer-led Investigations
Orewa	3	1
Devonport-Takapuna	3	0
Snells Beach/Algies Bay	2	1
Clarks Beach	1	2
Weiti	1	0
Waiuku	1	0

3.2 Level 4 Pollution Incidents 2025-2026

In the 2025-26 reporting year there were three overflow incidents that were classified as a level 4 pollution incident. These three incidents were from:

- Warkworth Street Pump Station (PS92) – Type-1 DWO (30th October 2025)
- Wastewater main near 21 Māori Hut Road – Typle-3 DWO (29th January 2026)
- Manhole (CK1305548) at 36 Māori Hut Road – Type-3 WWO (27th March 2026)

3.2.1 Warkworth Street Pump Station

A Level 4 pollution incident occurred on 30 October 2025 when a dry-weather wastewater overflow was identified at the Warkworth Street Wastewater Pump Station. Initial investigations indicated that a power surge had tripped the pump station pumps, resulting in a loss of pumping capacity. The station alarm and telemetry systems did not operate as intended, and the overflow was not detected until a site visit on the morning of 30 October 2025. The overflow is estimated to have commenced at approximately 2:30 pm on 29 October 2025 and continued until pump station operations were restored at approximately 8:00 am on 30 October 2025.

Wastewater discharged via the pump station's emergency overflow point into the Lucy Moore Memorial Park stormwater pond, which is hydraulically connected to the Mahurangi River. The total overflow volume was estimated at approximately 1,200 m^3, although the proportion of the discharge that ultimately reached the Mahurangi River could not be determined.

Immediate response actions included restoration of pump station operations, notification of Auckland Council Pollution Response and the Ministry for Primary Industries, and deployment of vacuum trucks and pumps to remove the wastewater and stormwater mixture from the pond and return it to the wastewater network. The pond was subsequently cleaned and replenished with freshwater to minimise ongoing environmental effects.

Environmental monitoring undertaken following the incident recorded elevated ammonia concentrations of up to 6 mg/L at the discharge location and approximately 25 m downstream, reducing to around 1 mg/L at approximately 100 m downstream. Follow-up monitoring confirmed that ammonia concentrations had reduced to non-detectable levels by 3 November 2025.

The incident was subsequently subject to regulatory investigation and information requests, including a Production Order and subsequent compliance review processes. These reviews examined

the causes of the overflow, the failure of the alarm and monitoring systems to detect the event, Watercare's response actions, and compliance with Network Discharge Consent requirements. The incident highlighted the importance of resilient power supplies, reliable alarm and telemetry systems, and timely environmental monitoring and remediation in managing risks to receiving environments.

3.2.2 Wastewater main near 21 Māori Hut Road

Level 4 pollution incident occurred on 29 January 2026 when a dry weather Type-3 wastewater overflow discharged from a failed 450 mm wastewater main near 36 Māori Hut Road, resulting in wastewater entering the adjacent estuarine environment. The incident was initially reported as a persistent wastewater odour along the coastal walkway and was subsequently investigated by field crews, who identified an active overflow from the wastewater network. CCTV inspections and excavation works confirmed a collapsed section of pipe and associated asset failure. Auckland Council Pollution Response was notified, and immediate response measures included wastewater flow control using suction trucks, isolation of the affected section of network, excavation and repair of the damaged pipe, and ongoing site monitoring. Following successful testing, the repaired asset was reinstated and the site restored. The incident reinforced the importance of proactive condition assessment and rapid investigation of odour complaints, which can provide early indication of network failures before more significant environmental effects occur.

3.2.3 Manhole at 36 Māori Hut Road

A Level 4 pollution incident occurred on 27 March 2026 when a wet weather Type-3 wastewater overflow discharged from manhole CK1305548 behind 21 Māori Hut Road, resulting in wastewater entering a nearby estuary. Investigations identified a damaged section of wastewater pipe downstream of the overflow location, which reduced network capacity during elevated wet weather flows and contributed to the discharge. Environmental monitoring undertaken during the response recorded ammonia concentrations of up to 8 ppm at the estuary entrance, indicating an adverse effect on the receiving environment. Auckland Council Pollution Response was notified, and immediate mitigation measures included establishment of a temporary bypass pumping system, deployment of additional pumps and generators, restriction of public access, site clean-up and disinfection, and ongoing environmental monitoring. CCTV investigations were subsequently undertaken to confirm the fault location and inform permanent repairs. Lessons learned highlighted the importance of rapid fault identification and maintaining contingency pumping capacity during prolonged wet weather response events

3.3 Dry weather overflows trend analysis

3.3.1 Introduction

This section summarises overflow trends over the last five reporting years (2022–2026) using annual totals, with methods tailored to each DWO type and the quality of the underlying data. For Type-1 DWOs (historical, validated), we apply a rolling five-year average to smooth inter-annual variability and highlight underlying patterns. For Type-2 DWOs (provisional and not validated), we limit analysis to a simple year-on-year comparison of the reporting year against the preceding year; the provisional status of these data constrains the application of more detailed statistical techniques. For Type-3 DWOs, which are compiled as annualised datasets, we assess trends using two complementary approaches:

- Visual inspection of annual counts to indicate the direction and magnitude of change; and
- Ordinary least squares linear regression with a significance threshold of $p < 0.05$

For each regression series, we report the slope (β), 95% confidence interval, p-value, and R^2. Given that each series comprises only five annual observations (2022-2026), we intentionally keep methods parsimonious and do not apply more complex tests such as Kendall or Mann–Kendall.

3.3.2 Type-1 trends

Of the 422 operational Type-1 EOPs, dry weather overflows have been recorded from 153 sites the period between July 2017 and June 2026 with 35 DWOs recorded in the 2025-26 reporting year as noted in Section 3.2.1[9].

Trends have been assessed through rolling five-year average comparisons, which indicate whether stations are showing increasing, decreasing, or static frequencies of DWOs (see Figure 3-5 and further detail in 0). Of the 153 pump stations analysed:

- 20 show a decreasing trend in overflows
- 110 remain stable with no discernible change and
- 23 sites show an increasing trend; however, all remain low in frequency, recording no more than 2 events per year during the 2025-26 reporting year, except for Weiti Pump Station (4 DWOs) and Cape Hill Road Pump Station and PS5 Oliver Road Pump Station (3 DWOs each)

Additionally, consistent with improvements across the network, 28 Type-1 EOPs have not recorded a DWO since July 2019, reinforcing the effectiveness of targeted asset renewals and operational maintenance in those areas.

[9] A data discrepancy was identified in the 2024-25 report. The report stated that 138 Type-1 EOPs were recorded between July 2017 and June 2025; however, the correct total was 120 Type-1 EOPs, meaning the reported value was overstated by 18 EOPs.

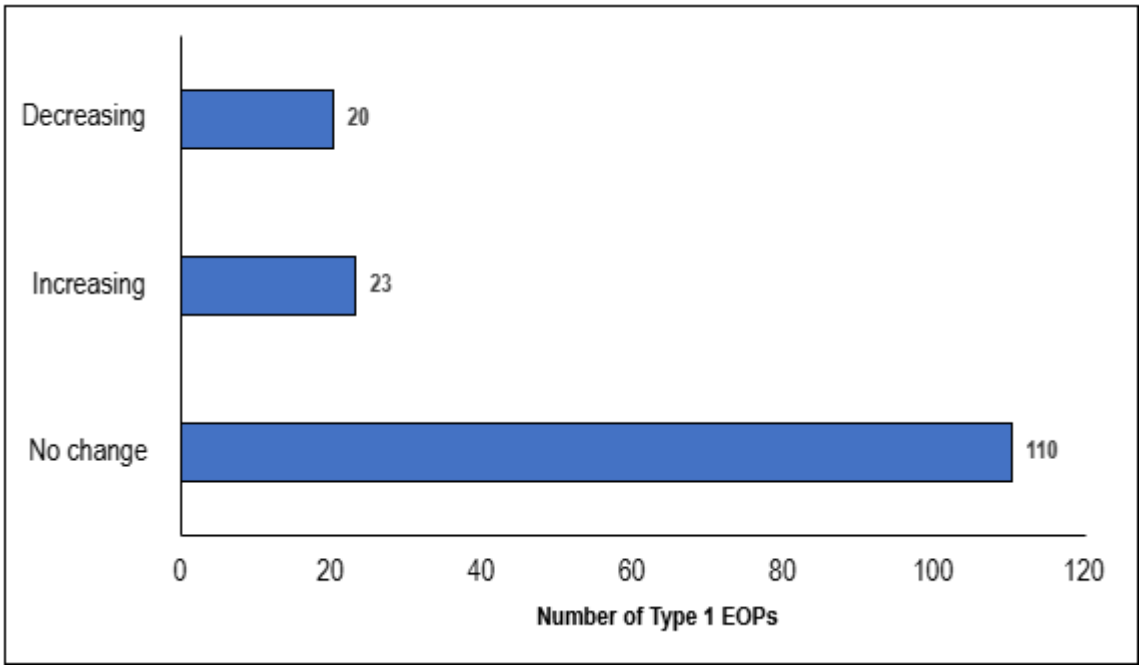

Figure 3-5: Bar graph showing the trend for the number of Type-1 EOPs with DWOs for the rolling five-year average totals

Figure 3-6 shows a generally variable long-term pattern of Type-1 DWOs, with the five-year rolling average indicating an overall decline from the higher levels observed in earlier years. In 2025-26, 35 Type-1 DWO incidents were recorded, increasing from 6 incidents in 2024-25. Despite this year-on-year increase, the five-year rolling average was 35.4 incidents in 2025-26, remaining below the higher rolling averages observed in 2022-23 and 2023-24 (41.2 and 41.6 incidents respectively). This indicates that the 2025-26 reporting period increase has returned annual incidents closer to the recent longer-term average rather than establishing a clear upward trend. Overall, the rolling average suggests that recent improvements have largely been maintained, although the increase in 2025-26 warrants continued monitoring.

The bar graph distribution (Figure 3-7) highlights that a small number of pump stations continue to account for a disproportionate share of Type-1 DWOs over the last five years. Compared with 2024-2025, the 2025-2026 results show some changes in the trend classification of the highest-contributing sites. Bremner WWPS remains the highest contributor with 10 DWOs and continues to show no discernible trend change. Cape Hill Road WWPS has increased from 5 to 8 DWOs over the five-year assessment period and remains on an increasing trend, while Weiti WWPS has entered the top 10 with 6 DWOs and is also showing an increasing trend. Rosedale WWPS has also entered the top 10 with 4 DWOs and is classified as increasing. In contrast, Cornell WWPS has reduced from 5 to 4 DWOs and continues to show a decreasing trend. Armitage WWPS, which previously showed a decreasing trend in 2024-2025, remains at 5 DWOs but is classified as showing no change in this reporting year. Overall, while most of the higher-contributing sites remain stable, the 2025-2026

results identify several sites with increasing trends that warrant continued monitoring and targeted operational follow-up.

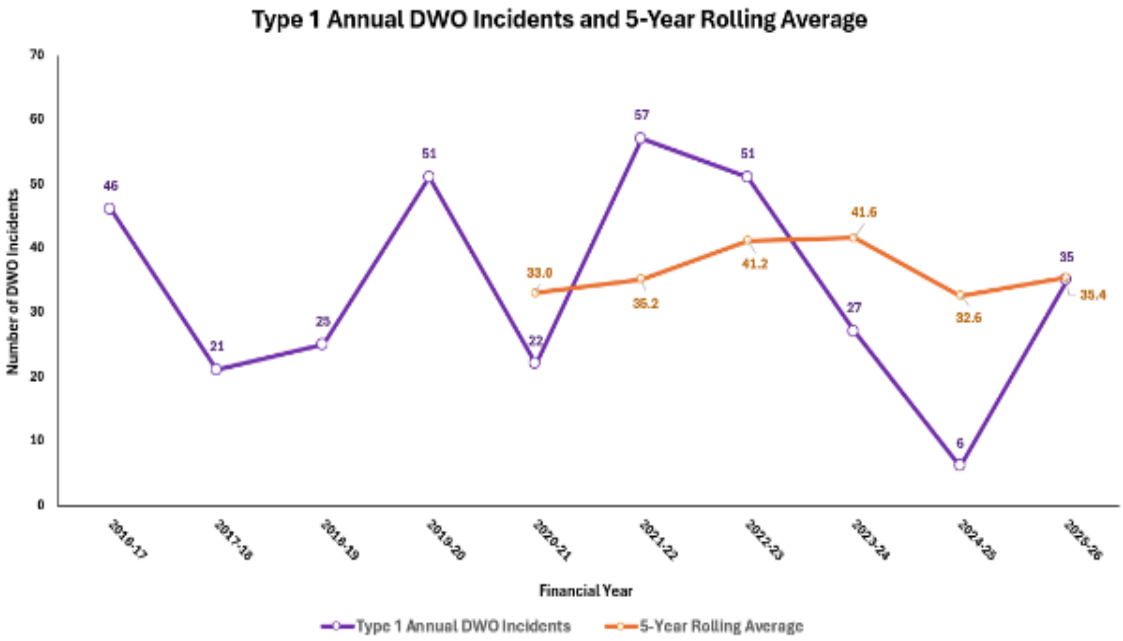

Figure 3-6: Type-1 annual DWOs (2017-2026) overlaid with the 5-year rolling average (2021-2026)

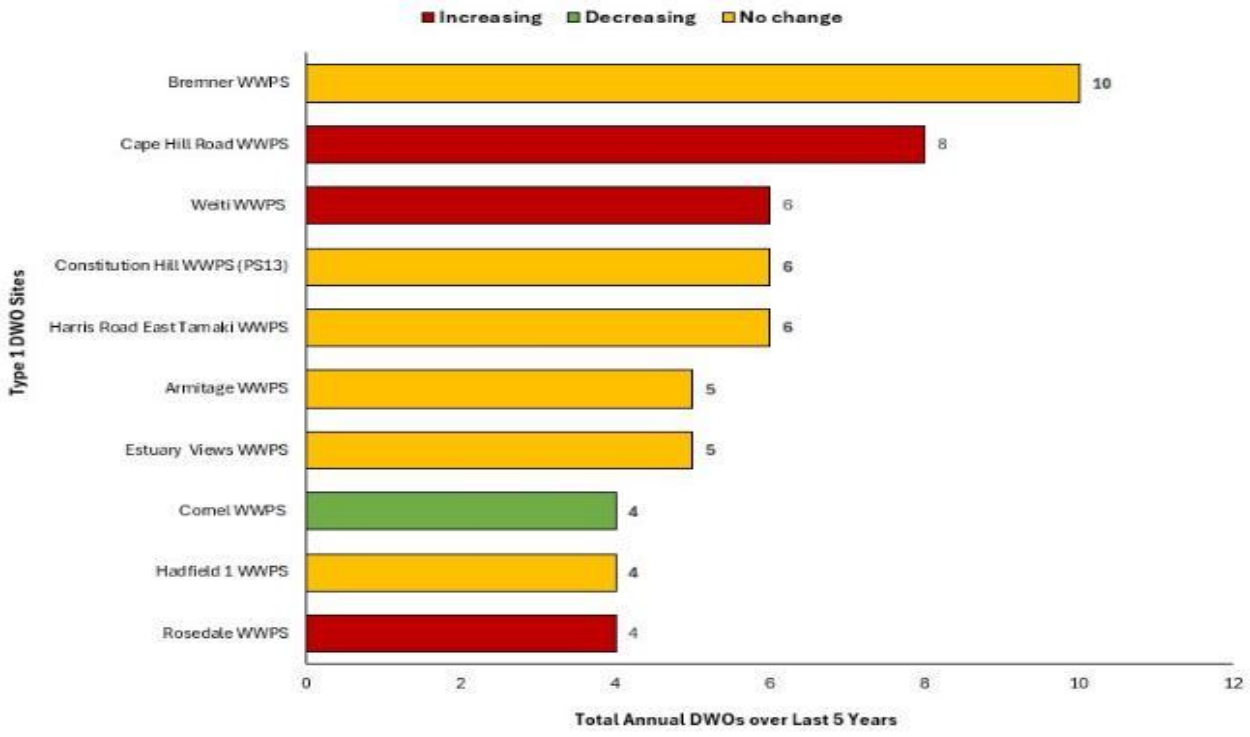

Figure 3-7: Top 10 Type-1 sites by total DWOs in the last five-years, with trend based on five-year (2022-2026) average

3.3.3 Type-2 trends

Type-2 DWOs are alarm-derived and not field-validated as explained in the earlier section. There is no explicit consent limit for Type-2 DWOs; the objective is to minimise and, where feasible, avoid DWOs through network enhancements and operational control. The following interpretations therefore guide risk-based prioritisation rather than compliance determinations:

- The top 15 EOPs account for 456 events, or 81.6% of the 2025-26 alarmed total (559) (Figure 3-8). This concentration indicates that targeted actions at a small set of assets can materially reduce the overall alarm burden. The top 15 include persistent contributors and several recent risers that warrant operational attention.
- Similar to last year's reporting period, Hobson Bay, Western Isthmus, and Cox's Bay dominate alarm volumes. The companion table, in
- Figure 3-9 shows which EOPs within each catchment drive the totals—useful for triaging work orders and scheduling inspections. Cox's Bay exhibits a mixed pattern: reductions at EOP 230 and 740 alongside a step-change increase at EOP 201. Western Isthmus shows varied movements across assets.

Year-on-year deltas (Figure 3-10) show mixed performance across the key Type-2 DWO EOPs in 2025-2026. The largest reductions occurred at EOP 727 (Western Isthmus), decreasing by 38 DWOs, and EOP 420 (Hobson Bay), decreasing by 17. In contrast, EOP 201 (Cox's Bay) increased by 14 DWOs, EOP 734 (Western Isthmus) increased by 13 and EOP 511 (Hobson Bay) increased by 5, representing the largest increases in this reporting year. Smaller increases were also recorded at EOP 728 (+6), while EOPs 505, 740 and 230 recorded reductions of 5, 1 and 8 DWOs respectively. These results show that the overall year-on-year change varies considerably between individual EOPs, including within the same catchment, highlighting the importance of site-specific monitoring and investigation rather than relying solely on catchment-level trends.

Implications for management

The analysis indicates that a small set of EOPs and three catchments; Hobson Bay, Western Isthmus, and Cox's Bay—drive the majority of Type-2 dry weather alarm activity in 2025-26. Watercare will continue to prioritise rapid diagnostics and targeted maintenance at the top-contributing EOPs, while scheduling catchment-level condition assessments and inflow control where alarms are concentrated. Sites showing sustained decreases will continue being monitored to protect gains. Given that Type-2 DWOs are alarm-derived and not field-validated, repeat alarm locations will be selectively verified to confirm root causes and eliminate false positives. These insights will inform the 2026-2027 reporting year work planning, with early-warning KPIs (monthly alarm density and step-change triggers) used to escalate response where thresholds are exceeded. A list of all Type-2 DWO alarms for 2025-26 are provided in 0.

3.3.4 Type-3 trends

In support of our annual performance reporting requirements, the following analysis details the statistical trends of Type-3 DWOs within the wastewater network from 2022 to 2026, highlighting key findings and areas of focus.

Regional and catchment-level statistical results that follow (Figure 3-11 to Figure 3-14; 0) identify where observed changes are robust and where further operational verification is recommended.

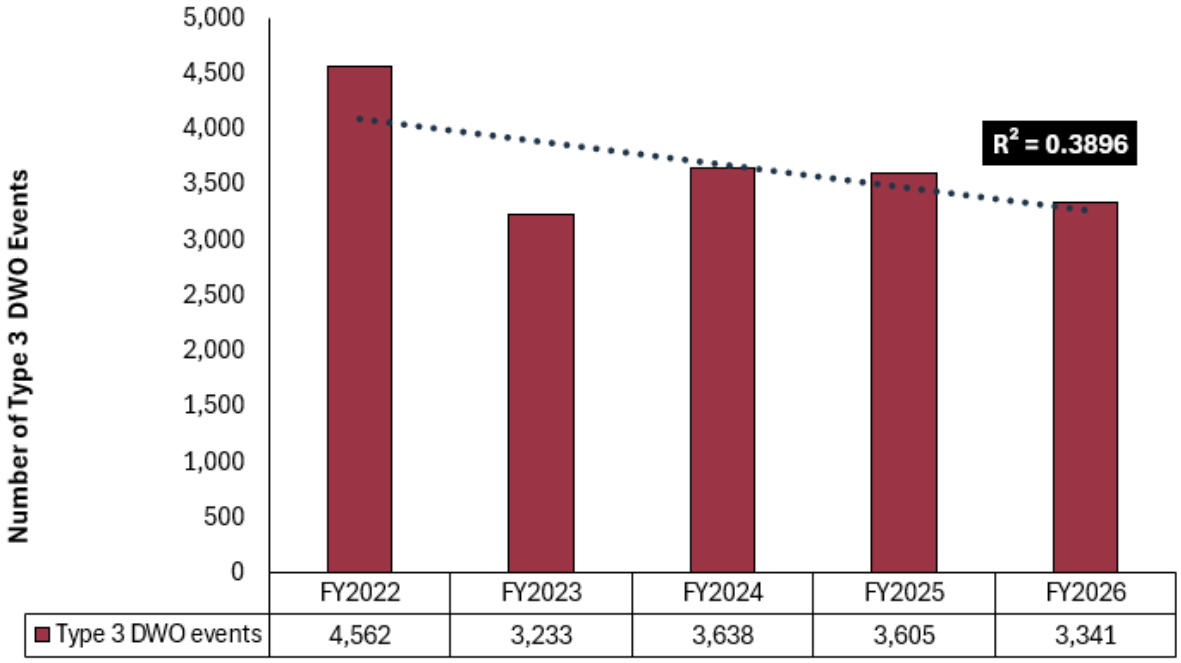

Figure 3-11: Total number of Type-3 DWOs from 2021-2022 to 2025-2026

Key findings

- Over the five reporting years 2022–2026, total Type-3 DWOs decreased from 4,562 to 3,341, a reduction of 26.8%. Counts fell to 3,233 in 2022-2023, rebounded to 3,638 in 2023-2024, then declined to 3,605 in 2024-2025 and 3,341 in 2025-2026, indicating an overall downward trend (Figure 3-12). Note: Counts exclude third-party damage. Third-party exclusions for 2022–2026 were 56 (2021-2022), 41 (2022-2023), 54 (2023-2024), 26 (2024-2025) and 16 (2025-2026) events respectively—193 in total.
- A simple Ordinary Least Squares (OLS) regression on annual Type-3 DWO totals for the five reporting years 2022–2026 estimates a decrease of approximately 207 DWOs per year. However, the 95% confidence interval (−683 to +269 DWOs per year) and p = 0.260 indicate that the linear trend is not statistically significant at the 5% threshold. The model's R^2 of 0.390 indicates that the trend explains approximately 39% of the variation in annual totals. Although counts decreased overall, substantial year-to-year variability and the short five-point series limit evidence of a sustained linear decline. The five-year regression output summary is provided in Appendix D.
- Auckland-wide cause analysis for the five reporting years 2022–2026 (3rd Party Damage excluded) found no statistically significant linear trends among individual causes. Broken Pipe

incidents are reported under 'Unknown' and are not shown as a separate cause. Foreign objects declined by 13.8 incidents per year ($p = 0.175$), while Fats (−46.7; $p = 0.558$) and Roots (−40.3; $p = 0.433$) also showed non-significant declines. Unknown (including Broken Pipe) fell from 1,973 to 491 incidents (−312 per year; $p = 0.099$), which is not significant and is distorted by the 2025–2026 classification change. Combining Unknown (including Broken Pipe) with Blockage of Unknown Origin to account for that change shows a significant decline of about 115 incidents per year ($p = 0.011$). A regional model including cause and year explains 82.7% of the variation (adjusted $R^2 = 78.2\%$; $F = 18.65$; model $p < 0.001$), although the overall year effect is not significant ($p = 0.421$).

- Catchment × cause OLS analysis for 2022–2026 identified 16 statistically significant local trends ($p < 0.05$): 10 decreases and six increases. Of the four previously highlighted examples, only Roots in Central Auckland (CBD) remained significant, falling from 29 to six incidents ($\beta = -5.2$ per year; $p = 0.021$). Roots declined in Hobson Bay (122 to 54; $p = 0.098$) and Onehunga (59 to 25; $p = 0.055$), while Fats declined in East Coast Bays (80 to 32; $p = 0.077$), but these did not meet the 5% threshold. Five of the 10 significant decreases are in Unknown (including Broken Pipe): East Coast Bays, Pahurehure Inlet, Mangere, Pukekohe and Devonport-Takapuna.
- Under-performing catchments for 2025-2026, based on the highest annual frequencies and cumulative 2021-2022 to 2025-2026 financial year totals, are Upper Tāmaki River (490 in 2025-2026; 2,214 over five years), Henderson Creek (253; 1,710), and Western Isthmus (282; 1,693). Fats and Roots remain the dominant known drivers. Table 3-5 displays the highest total Type-3 DWOs from the reporting years 2021-2026.

Methodology

- Primary method: OLS regressions applied to annual counts (2021–2026). Analyses comprise:
    - Regional time-series OLS on annual totals (contextual overview)
    - Regional OLS with cause effects (count ~ cause + year) to assess cause contributions across Auckland
    - Separate OLS regressions for each catchment × cause to detect local, cause-specific trends
- Significance: results reported at $p < 0.05$ unless stated otherwise; full regression summaries and diagnostics are provided in Appendix E Visual frequency plots and cause tables are in Appendix D and Figure 3-12 to Figure 3-14.
- Data scope: annual aggregated counts by catchment and cause for 2021–2026

Auckland wide regional trends by cause (2022–2026)

Annual Type 3 DWO counts by cause across Auckland were analysed for the five reporting years 2021-2022 to 2025-2026, excluding third-party damage and Outside NDC. Broken Pipe incidents are reported under Unknown. No individual cause exhibited a statistically significant linear trend at the 5% threshold. Fats (−46.7 incidents per year; $p = 0.558$), Roots (−40.3; $p = 0.433$) and Foreign Object (−13.8; $p = 0.175$) showed non-significant downward trends. Unknown (including Broken Pipe) fell from 1,973 to 491 incidents (−311.7 per year; $p = 0.099$), but this reduction was not significant and is partly attributable to the introduction of the Blockage of Unknown Origin classification in FY2026. When Unknown (including Broken Pipe) and Blockage of Unknown Origin are combined, Unknown-

related incidents declined significantly by 115 incidents per year ($p = 0.011$). The model incorporating cause and year effects explained 82.7% of the variation in annual counts (adjusted $R^2 = 78.2\%$; $F = 18.65$; model $p < 0.001$), although the overall year effect was not statistically significant ($p = 0.421$). Regional cause frequencies for the reporting year 2021-2022 to 2025-2026 are presented in Figure 3-13 with full model outputs provided in Appendix D.

Catchment-specific trends

Separate OLS regressions were conducted for each catchment × cause combination across the reporting year 2022–2026, using a significance threshold of $p < 0.05$. Broken Pipe incidents are reported under Unknown. Across 273 combinations, 16 statistically significant trends were identified: 10 decreases and six increases. Of the four previously highlighted decreases, only Roots in Central Auckland (CBD) remained statistically significant, declining from 29 to six incidents ($\beta = -5.2$ incidents per year; $p = 0.021$). The declines in Roots in Hobson Bay (122 to 54; $p = 0.098$), Roots in Onehunga (59 to 25; $p = 0.055$) and Fats in East Coast Bays (80 to 32; $p = 0.077$) did not meet the significance threshold over this five-year period. They were highlighted because of their large event volumes, but are best read as indicative downward trends, not confirmed reductions.

Other significant decreases in known causes were Foreign Object in Henderson Creek, Roots in Helensville, Fats in Devonport-Takapuna, and Rags in Waiuku. These involve smaller volumes and are less prominent but are worth noting. Five decreases occurred in the Unknown category (including Broken Pipe): East Coast Bays, Pahurehure Inlet, Mangere, Pukekohe and Devonport-Takapuna. These require caution because the introduction of Blockage of Unknown Origin in 2025-2026 may contribute to the apparent reductions.

The six significant increases were Rubbish in Whau River, Onehunga, Lower Tamaki River and Cox's Bay; Fats in Clarks Beach; and Rags in Beachlands-Maraetai. These were low-volume series, with 2025-2026 counts ranging from two to six incidents. Their practical significance should therefore be assessed alongside event volumes rather than statistical significance alone.

Since Broken Pipe is now reported under Unknown, it is no longer assessed as a separate cause, and the Western Isthmus Broken Pipe decline seen in the earlier separate analysis (48 to 10 incidents; $\beta = -8.7$ incidents per year; $p = 0.007$) does not appear as a significant trend once combined with Unknown. Significance tests were not adjusted for multiple comparisons, so findings should be treated as exploratory rather than definitive evidence of sustained change.

Overall, the significant local decreases are concentrated in the Unknown category (five of the 10) and in low-volume known-cause series. The largest known-cause declines, Roots in Hobson Bay and Onehunga and Fats in East Coast Bays, did not reach statistical significance over this five-year period. The six significant increases are all low-volume series.

Under-performing catchments (2025/26 focus)

Upper Tāmaki River, Henderson Creek and Western Isthmus recorded the highest cumulative Type 3 DWO totals over the five reporting years 2021-22 to 2025-26. Upper Tāmaki River recorded 490 DWOs in 2025-26 and 2,214 over the five-year period, followed cumulatively by Henderson Creek (253 in 2025-26; 1,710) and Western Isthmus (282; 1,693). These were not the three highest-frequency catchments in the reporting year 2025-2026 alone: Western Isthmus ranked second and East Coast Bays third with 277 events, ahead of Henderson Creek in fourth. Fats and Roots were the

leading specifically identified causes across these catchments. In Upper Tāmaki River, both fell in 2022-23 and then increased each year, reaching 148 Fats-related and 105 Roots-related DWOs in 2025-26. Western Isthmus recorded 43 Fats-related and 50 Roots-related incidents, while Henderson Creek recorded 52 and 63 respectively; these counts were below their 2021-22 levels. Unknown incidents (including Broken Pipe) fell sharply in 2025-26 in all three catchments: from 217 to 71 in Upper Tāmaki River, 162 to 40 in Henderson Creek and 203 to 38 in Western Isthmus. This is partly attributable to the introduction of Blockage of Unknown Origin, which accounted for 110, 68 and 119 incidents respectively in 2025-26 as Broken Pipe is reported under Unknown, the separate Western Isthmus Broken Pipe decline seen in the earlier analysis is not assessed as an individual trend.

Limitations

Our analysis employed OLS regression over a six-year window (2021–2026) to assess trends in DWOs across catchments and blockage causes. This approach provides straightforward interpretation of annual rates of change (beta coefficients) and goodness-of-fit (R^2) for each catchment-cause combination. The OLS method assumes linear trends and normally distributed residuals, which are reasonable approximations for the observed data patterns.

This analysis does not include robustness checks such as nonparametric trend tests, count-data regression models, or multiple testing corrections. The preliminary OLS results presented are broadly consistent with the visual trends observed in the data.

Table 3-5 Top 10 catchments with highest total Type-3 DWOs from 2021-2022 to 2025- 2026

Catchment	2021-2022	2022-2023	2023-2024	2024-2025	2025-2026	Total
Upper Tāmaki River	529	369	391	435	490	**2,214**
Henderson Creek	385	315	391	366	253	**1,710**

4 WET WEATHER OVERFLOWS

4.1 Introduction

This section presents the analysis of WWOs from the NDC catchments in 2025-2026. The details of Type-1, Type-2, and Type-3 overflows are presented separately for the monitoring year as well as for longer-term trends. 0 has details of all individual WWOs from the monitoring year.

4.2 Wet weather overflows 2025-2021

Table 4-1 provides a summary of WWOs that occurred during the reporting period 1 July 2025 to 30 June 2026. A total of 1,623 WWOs were recorded across Type-1, Type-2 and Type-3 events.

Controlled WWOs from Type-1 EOPs increased from 96 events in 2024-25 to 144 events in 2025-26, representing an increase of 50%. The increase was primarily attributable to surcharge/heavy rain events, which increased from 88 to 141 occurrences and accounted for almost all Type-1 WWOs recorded during the reporting period.

Type-2 WWOs increased from 410 events in 2024-25 to 442 events in 2025-26, an increase of approximately 8%. All Type-2 WWOs recorded during the reporting period were attributed to surcharge/heavy rain conditions, highlighting the continued influence of wet weather on network performance.

Type-3 WWOs increased from 952 events in 2024-25 to 1,037 events in 2025-26, representing an increase of approximately 9%. The increase was largely attributable to surcharge/heavy rain events, which increased from 277 to 485 occurrences and remained the leading cause of Type-3 WWOs. Surcharge/heavy rain accounted for 46.8% of all Type-3 WWOs recorded during the reporting period.

The 2025-26 reporting period also introduced the "Blockage of Unknown Origin" classification, which accounted for 187 Type-3 WWOs (18.0%). This classification is applied where a blockage is identified as the likely cause of the overflow, but insufficient evidence is available to determine the specific blockage material. The introduction of this category has improved cause attribution and reduced reliance on the broader "unknown" classification, which decreased from 368 events in 2024-25 to 0 events in 2025-26.

Overall, the increase in WWOs during the reporting period was primarily driven by wet weather-related surcharge events. Total WWOs increased from 1,458 in 2024-25 to 1,623 in 2025-26, an increase of approximately 11%. The results continue to highlight the influence of inflow and infiltration on network performance during periods of high rainfall, while improvements in overflow cause attribution have enhanced understanding of the underlying drivers of blockage-related overflows.

Table 4-1 Summary and comparison of causes of WWOs between 2024-25 and 2025-26

	Type 1		Type 2		Type 3	
Cause	**2024-25**	**2025-26**	**2024-25**	**2025-26**	**2024-25**	**2025-26**
Broken pipe	0	0	Not Recorded	0	28	0
Fats	0	0		0	91	131
Foreign objects	0	0		0	10	16

4.2.1 Type-1 overflows

During wet weather events, particularly during periods of heavy rain, multiple pump stations may overflow at the same time. Wet weather data has therefore been validated against rainfall records from rain gauges, alongside flow and level data from telemetry devices. The procedure for recording and validating pump station overflows continues to improve, and it is likely that more events are being captured now than in previous years.

The NDC requires that an average of no more than two, or the determined alternative discharge frequency (ADF), of WWOs should occur from an EOP per year. A total of 144 Type-1 WWOs were recorded during the 2025-2026 reporting year across 422 operational pump stations. Out of the 144 Types-1 WWOs 73 were recorded from local networks and 71 WWOs were recorded from transmission sites. Upper Tāmaki River accounted for the highest number of Type-1 WWOs (21), followed by Shoal Bay (19), while East Coast Bays and Beachlands each recorded 12 events.

In total, 72 Type-1 EOPs recorded at least one WWO. Across the region, 26 catchments reported at least one Type-1 WWO during this period, while 10 catchments did not record any Type-1 WWOs. The distribution of catchments where there was at least one overflow is presented in Figure 4-1.

To identify which individual pump stations are under-performing, we compared 5-year average overflow frequencies against their specific ADF or NDC limit of no more than two WWOs per year. Using this method, we have determined that there are 30 under-performing Type 1 EOPs, although

[10] WWOs recorded with an unknown cause were categorised as surcharge/heavy rainfall for reporting purposes, as wet weather conditions are a common driver of wastewater overflows and this classification was considered the most appropriate where no alternative cause could be identified

only 10 of these recorded WWO frequencies above their limit during the 2025-26 reporting year, which may suggest a recent improvement. These 10 under-performing pump stations are listed in Table 4-2 along with comments and planned improvements. The poorest performing pump station remains Seabreeze WWPS in Shoal Bay, followed by Lake Road WWPS also in Shoal Bay, and Third View WWPS in Beachlands Maraetai. Further discussion and trend analysis are provided in Section 4.3.2.

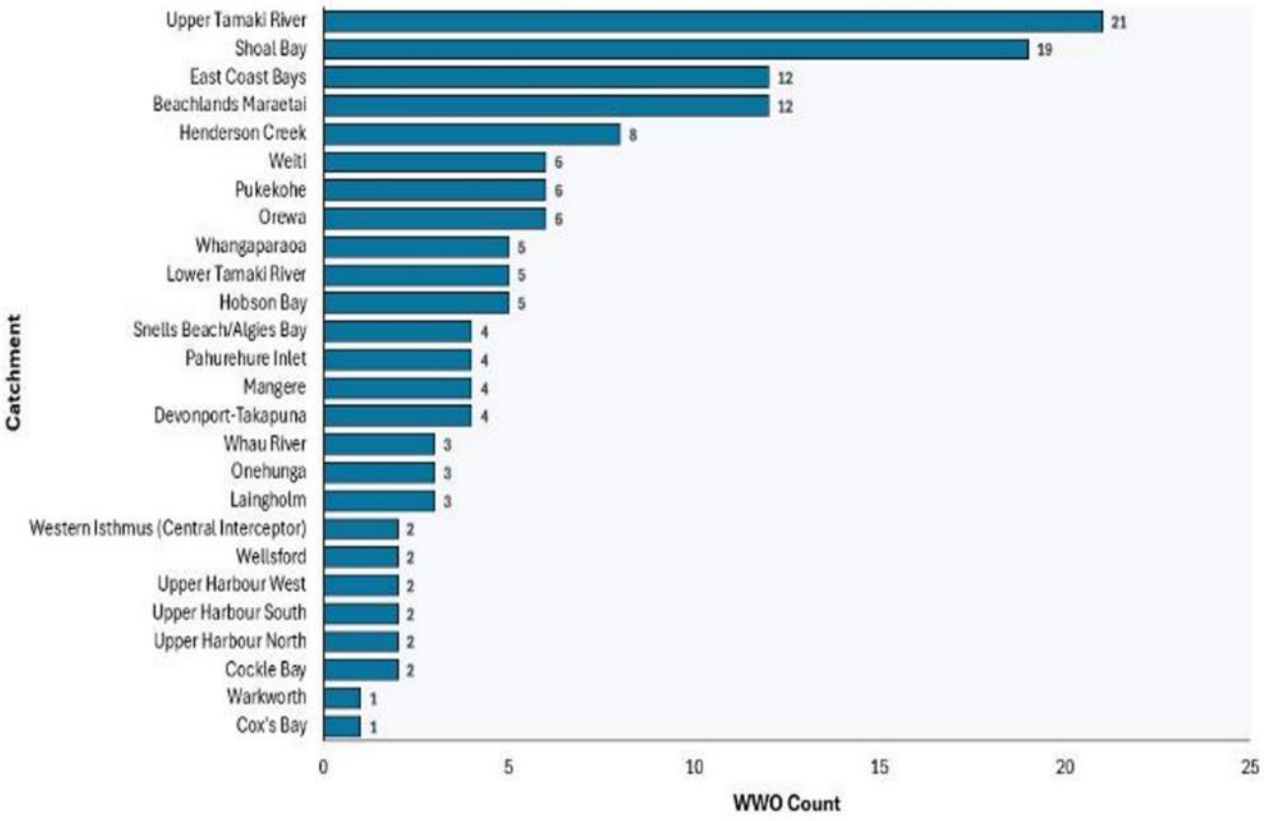

Figure 4-1: Summary and comparison of causes of WWOs between 2024-25 and 2025-26

Table 4-2 Summary of under-performing Type-1 EOPs for the 2025-2026 reporting period

Facility	Name	EOP ID	Catchment	2025-26 WWOs	NDC/ ADF Limit	5-year average	Comments and planned improvement projects	Project name	Est. start-end date
DPSEA	Seabreeze WWPS	849	Shoal Bay	9	2	10.2	WWOs lower than 5-yr average. Further investigations are recommended to identify the WWO root cause as it is over the threshold.	N/A	N/A
DPLNO	Lake Road Northcote WWPS	830	Shoal Bay	6	2	10.2	There will be an additional new pump station, rising main and gravity main diverting flows to the Birkdale Branch Sewer, to reduce overflows to nearby beaches.	Northcote–Chatswood Wastewater Network	2018–2028
DPTVW	Third view WWPS	1,083	Beachlands Maraetai	6	2	3	There has been a significant increase in WWO since last year, raising the 5-year average above the limit this year. Further investigation is required to determine why there has been a sudden increase in WWOs here.	N/A	N/A
DPWEI	Weiti WWPS	822	Weiti	5	2	7.6	There are currently no specific improvement projects in place that would reduce WWOs at this PS. However, there are growth-related projects in Weiti aimed to remove bottlenecks within the network and improve capacity, which may reduce overflows here.	Silverdale West WW Rising Main	Feasibility phase, expected completion in 2037
DPCHR	Cape Hill Road WWPS	1,247	Pukekohe	5	2	2.2	There has been a significant increase in WWO since last year, raising the 5-year average above the limit this year. Further investigation is required to determine why there has been a sudden increase in WWOs here.	There are multiple projects designed to support new infrastructure growth and take pressure off current network in Pukekohe.	N/A

Facility	Name	EOP ID	Catchment	2025-26 WWOs	NDC/ ADF Limit	5-year average	Comments and planned improvement projects	Project name	Est. start-end date
DPFLN	Western WWPS (PS44)	690	Henderson Creek	4	2	7	The Northern Interceptor project completed in June 2025 and is expected to reduce controlled overflows from EOPs and provide additional capacity to the Western Interceptor which DPFLN feeds into once it becomes fully operational.	Northern Interceptor Stage - 1	2021 – 2026 Construction complete, connections to finish end of 2026
DPTEN	Te Atatu North WWPS (PS42)	692	Henderson Creek	4	3	9	There are known capacity constraints in the local network that feed into this pump station. The Northern Interceptor is planned to divert catchments away from the Western Interceptors, reducing WWOs at various EOPs including Te Atatu. The construction of the interceptor completed in June 2025.	Northern Interceptor Stage - 1	2021 – 2026 Construction complete, connections to finish end of 2026
DPBLA	Black Rock WWPS	947	East Coast Bays	3	2	7.2	Wairau PS upgrades should significantly reduce Black Rock overflow frequencies, as it should not need the current interlock system.	Wairau Wastewater Pump Station Upgrades	2022-2032 Currently in Feasibility stage.
DPOTW	Otahuhu West WWPS (PS19)	680	Mangere	3	2	5.2	WWO frequency remains steady since last year, overflowing once more than the limit. There are no planned works targeting this area.	N/A	N/A
DPDAL	Daltons WWPS	1,106	Snells Beach/ Algies Bay	3	2	3.4	WWO frequency has increased this year, and is over the limit by 1 overflow per year. There are no planned works targeting this area.	N/A	N/A

*NDC/ADF Limit refers to either the Network Discharge Consent Condition 9(a) limitations of not more than 2 overflows per year or the calculated Alternate Discharge Frequency (ADF) per year for that EOP as per the WW Network Strategy whichever is applicable. **Refer to section 6 for further details on the project

4.2.2 Type-2 overflows

Type-2 EOPs are designed as controlled reliefs during elevated flows to protect private property from wastewater spills. As noted in Section 3.1.2, alarms from Type-2 EOPs are indicative only, as they are not subject to field validation. A total of 95 Type-2 EOPs are currently telemetered. Their purpose is to highlight potential problem sites and areas. Wet and dry weather classification continue to be determined based on the total rainfall in the preceding 24 hours, rather than by confirming the hydraulic cause (e.g. surcharging). It is also noted that only a fraction of Type-2 sites are fitted with telemetry, meaning the alarm frequencies reported here are not representative of total network performance.

For the 2025-26 reporting period, there were 442 Type-2 WWO alarms recorded across 62 of the 95 telemetered sites, an increase of 7.8% compared with the previous year. The poorest-performing catchment was Hobson Bay, which recorded 149 alarms, followed by Henderson Creek (89 alarms) and the Western Isthmus (Central Interceptor) catchment (51 alarms) as seem in Figure 4-2.

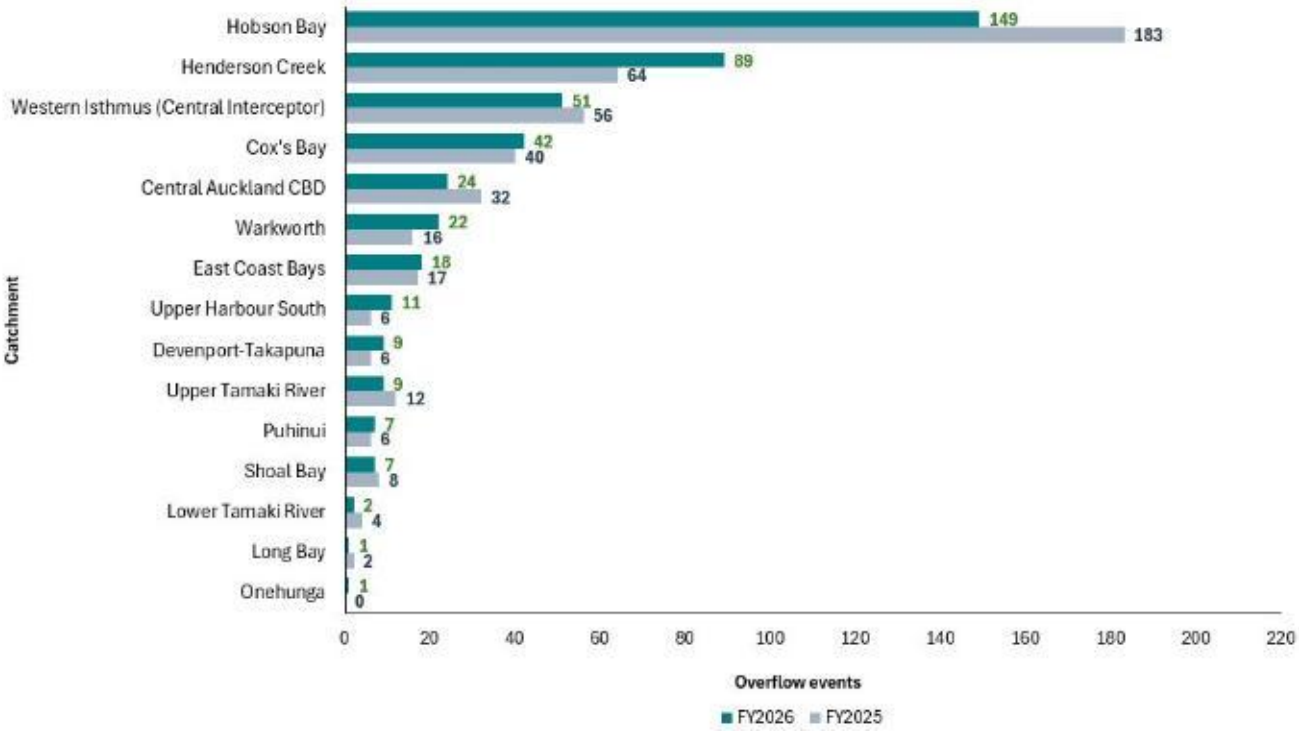

Figure 4-2: Total Type-2 WWOs per catchment for reporting period 2024-2025 Vs. 2025-26

Given historical uncertainties in Type-2 overflow records, performance is assessed using only the past two reporting periods to derive a two-year average WWOs per EOP. This two-year average is compared with each EOP's ADF-based limit or the NDC limit of no more than two WWOs per year. Using this method, 18 Type-2 EOPs are assessed as underperforming. The poorest-performing EOPs by two-year average were EOP 740 (Branch 5 Herne Bay MH23/ Argyle Street, Cox's bay), EOP 734 (28 Morning Star Pl, Sandringham, Western Isthmus) and EOP 201 (Intersection of Sarsfield and Lawrence Streets, Herne Bay Networks, Cox's Bay). Full details of Type-2 overflows can be found in Appendix D, and a summary of their performance can be found in Table 4-3.

Table 4-3 Summary of Type-2 EOP performance based on annual average WWOs for each EOP over two years

4.2.3 Type-3 overflows

During the 2025-26 reporting period, 1,037 Type-3 WWOs were recorded, compared with 952 in 2024-25 and 828 in 2023-24 (Table 4-5). This represents a continuing increase in the total number of Type-3 WWOs over the past three reporting periods. However, Type-3 WWOs originating from the transmission network decreased from 72 events in 2024-25 to 66 events in 2025-26, suggesting a modest improvement in transmission network performance.

The relative contribution of recorded overflow causes has changed over time. Surcharging accounted for 34% of Type-3 WWOs in 2023–24, decreased to 29% in 2024–25, then increased to 48% in 2025–26. Known blockages, including Broken Pipe in 2023–24 and 2024–25 only, accounted for 38%, 31% and 35%, respectively. The remaining category—mechanical/power failure, Unknown Blockage and remaining Unknown cause which increased from 28% in 2023–24 to 40% in 2024–25, before decreasing to 17% in 2025–26.

Third-party damage is excluded throughout. For 2025–26 only, both the original Unknown events and the 16 Broken Pipe events are included in Surcharging, not in the remaining category. This classification change limits direct year-to-year comparison; the changes in proportions should not be interpreted solely as changes in underlying causes. Overall, the results indicate a continued decline in the proportion of surcharging-related Type 3 WWOs over the past three reporting periods, while overflows attributed to unknown blockages and unknown causes have become an increasingly

significant component of total recorded events. Third-party damage is excluded from all three reporting periods. Full details of Type 3 WWOs are provided in Appendix D.

Table 4-5 Comparison of Type-3 WWO totals and causes (expressed as a percentage of the total) per year for the 2022-2023 to 2025-2026 reporting year

	2022-2023	2023-2024	2024-2025	2025-2026
Total overflows	2,312	828	952	1,037
Known blockages	17%	38%	30.9%	35%
Surcharging	66%	34%	29.1%	48.3%
mechanical/power failure, Unknown Blockage and unknowns	17%	28%	40%	16.8%

The poorest-performing catchments in 2025/26 were:

- Upper Tamaki River – 148 WWOs
- Henderson Creek – 120 WWOs
- East Coast Bays – 99 WWOs
- Western Isthmus (Central Interceptor) – 98 WWOs
- Whau River – 75 WWOs

Collectively, these five catchments contributed 540 WWOs, representing 52% of all Type-3 WWOs recorded during the reporting period. This highlights the continued concentration of overflows within a relatively small number of catchments that have historically experienced elevated numbers of wet-weather overflows that also recorded high numbers of wet-weather overflows in 2024-2025.

A comparison of catchment totals between the 2024-2025 and 2025-2026 reporting periods is presented in Figure 4-3. Upper Tāmaki River recorded the largest increase in Type 3 WWOs, with 49 additional events compared with the previous reporting period, followed by Henderson Creek with 23 additional events and Whau River with 20 additional events. East Coast Bays and Western Isthmus (Central Interceptor) also recorded increases, of 2 and 15 events respectively, compared with 2024-2025.

As seen in Table 4-6 the composition of the poorest-performing catchments remained broadly consistent between 2024-2025 and 2025-2026, with the same five catchments recording the highest numbers of Type 3 WWOs: Upper Tāmaki River, Henderson Creek, East Coast Bays, Western Isthmus (Central Interceptor) and Whau River. Hobson Bay ranked sixth in both periods. Despite reductions in several catchments, including Pahurehure Inlet (13 fewer events), Central Auckland (CBD) (11 fewer events), Wellsford (four fewer events), and Shoal Bay and Lower Tāmaki River (three fewer events each), the total number of Type 3 WWOs increased by 162 events (18.5%), from 875 in 2024-2025 to 1,037 in 2025-2026.

Wellsford recorded no Type 3 WWOs during 2025-2026, compared with four in 2024-2025. However, Waiwera recorded one event, compared with none in the previous period, while Central Auckland (CBD) recorded 15 events, down from 26. These results indicate localised improvements rather than a consistent reduction across the network. The overflow counts alone do not establish whether reductions resulted from network upgrades or other factors, such as differences in rainfall

or operational conditions. Continued monitoring, supported by rainfall and operational data, will be required to assess whether these improvements are sustained and to evaluate the contribution of network investment.

Frequency relative to pipe length

When benchmarked against network size, the highest frequency per kilometre of pipe occurred in Upper Harbour South and Waiwera (0.24 WWOs/km), followed by Whau River (0.20 WWOs/km), East Coast Bays (0.19 WWOs/km) and Cockle Bay (0.17 WWOs/km). In Upper Harbour South and Waiwera, relatively small networks experienced disproportionately high spill frequencies due to their limited network extent. East Coast Bays continued to rank among the highest-performing catchments on a per-kilometre basis, despite recording a slight reduction in total WWOs compared with the previous reporting period. Similarly, Whau River and Cockle Bay recorded relatively high overflow frequencies when normalised against network size, indicating ongoing localised capacity and service performance pressures. At the other end of the spectrum, Kumeū/Huapai/Riverhead and Oneroa recorded no Type-3 WWOs during the reporting period, while Wellsford recorded a negligible overflow frequency (less than 0.01 WWOs/km). Details of all catchment frequency ratios are presented in Figure 4-4.

Differences in incident levels

During the 2025–2026 reporting period, 169 Type-3 WWOs were classified as Level-2 incidents meaning that the overflow reached a waterbody. This represents a substantial increase compared with the 2024–25 reporting period, where only 57 overflows were reported to have entered a waterbody. A total of 25 overflows were classified as Level-3 incidents, compared with six in the previous reporting year. In addition, one overflow was classified as a Level-4 incident, whereas no Level-4 incidents were recorded in 2024–2025.

Table 4-6 Comparison of total number of Type-3 WWOs per catchment during current (2025-2026) and previous reporting period (2024-2025)

Catchment	2025-2026	2024-2025	YoY Change	YoY %

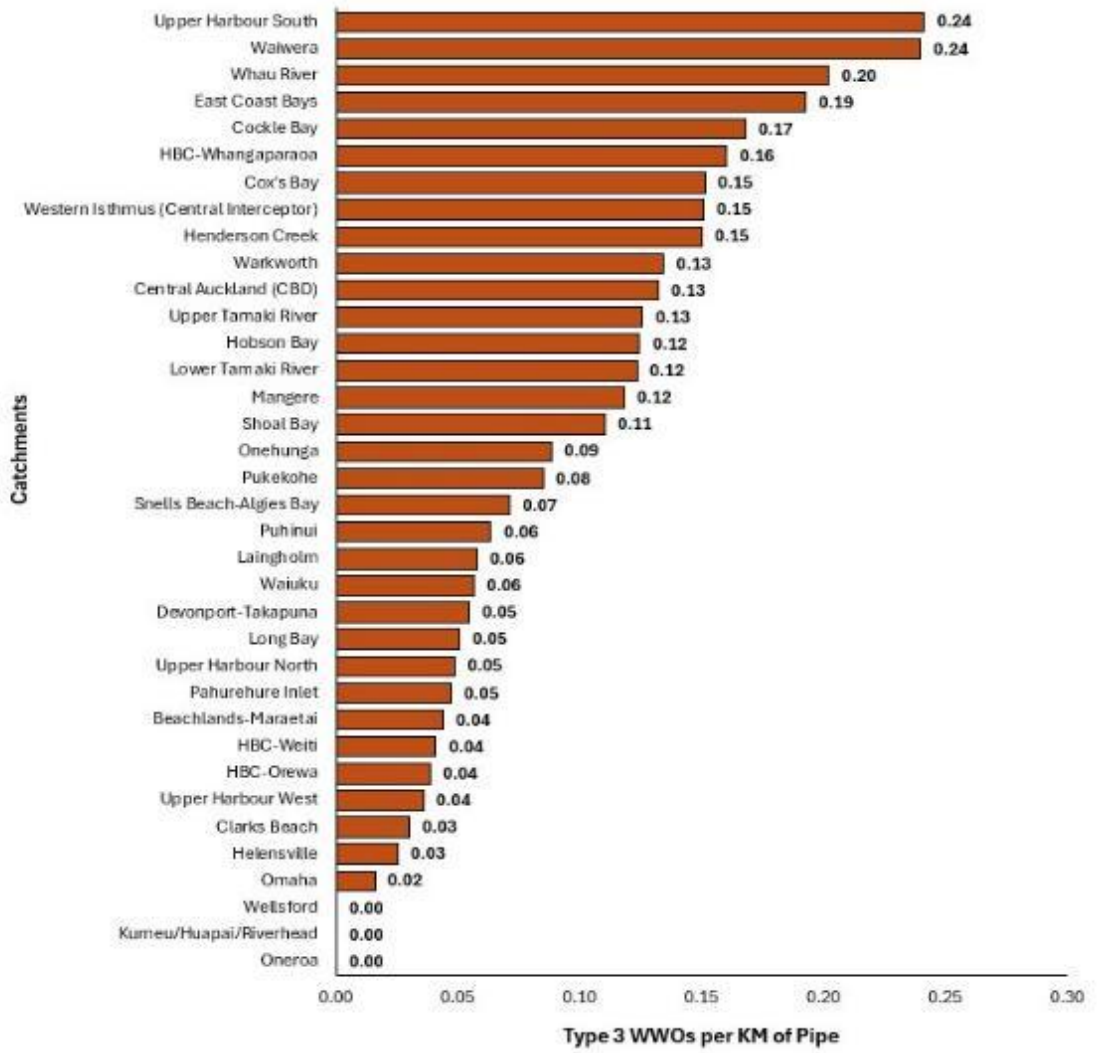

Figure 4-4: Local Type-3 WWOs per 1 km of wastewater network pipe per catchment in 2025-2026

Repeat WWOs

Repeat WWOs can suggest capacity constraints or infiltration and inflow issues that may need further investigating to resolve. The catchments with the highest number of repeat WWO sites where it overflowed more than twice in the reporting period are:

- Upper Tamaki River with 53 sites
- Henderson creek with 33 sites
- Western Isthmus with 32 sites

A summary of the number of repeat wet weather issues and engineer-led investigations can be found in Table 4-7. The catchment with the highest number of engineer-led investigations was Pahurehure inlet.

Table 4-7 Summarising number of wet weather engineer-led investigations per catchment for the reporting period 2025-26

Catchment	No. of Repeat Overflow Sites per Catchment	No. of Engineer-led investigations
Upper Tamaki River	53	5
Henderson Creek	33	4

4.3 Wet weather overflows trend analysis

4.3.1 Introduction

The trend analysis performed on historical Type-1 WWOs uses a rolling five-year average. For Type-2 WWOs (provisional and not validated), we limit analysis to a simple year-on-year comparison of the reporting year against the preceding year; the provisional status of these data constrains the application of more detailed statistical techniques. The trend analysis used for Type-3 WWOs uses annualised data and two techniques:

- Visual assessment
- Statistical analysis using simple linear regression models

Analyses were conducted using a p-value threshold of <0.05 for significance and <0.10 for emerging significance. Given that each series comprises only five annual observations, we intentionally keep methods parsimonious and do not apply more complex tests such as Kendall or Mann–Kendall.

4.3.2 Type-1 trends

Of the 422 operational Type-1 EOPs, there have been overflows from 259 of them between July 2017 and June 2026. Furthermore, as stated in Section 4.2.1, only 144 Type-1 EOPs overflowed during the 2025-2026 reporting period. Analysis of the 278 Types-1 indicates that 4 have not recorded a WWO since July 2017, 33 since July 2019, 52 since July 2021, 170 pump stations have not recorded an overflow since July 2023, 196 pump stations have not recorded any overflows since July 2024 and 206 from July 2025. Details of the rolling six-year averages for each of the 278 Type-1 EOPs and the trends observed is provided in Appendix F and summarised in Figure 4-5.

Comparison of the latest 5-year averages, ADFs and the consent's no more than 2 overflows per year on average limit, has been discussed in Section 4.2.1. From this we concluded that of the 30 under-performing Type-1 EOPs, only ten under-performed during the 2025/26 reporting year, of which nine showed an increasing trend in WWOs, and one remained steady. Of the remaining twenty under-performing Type 1 EOPs based on 5-year averages, analysis showed a decreasing WWO trend at seven pump stations, no change at 3 pump stations, and an increasing trend at ten pump stations. The seven pump stations showing a decreasing trend in WWOs are as follows:

- PS 5 Oliver Road WWPS (PS5) in Western Isthmus
- Palmer WWPS in Warkworth
- Cronin WWPS in Upper Harbour South
- Worker Road WWPS in Wellsford
- Armitage WWPS in Wellsford
- Lilburn WWPS in Warkworth
- Brigitte WWPS in Snells Beach/ Algies Bay

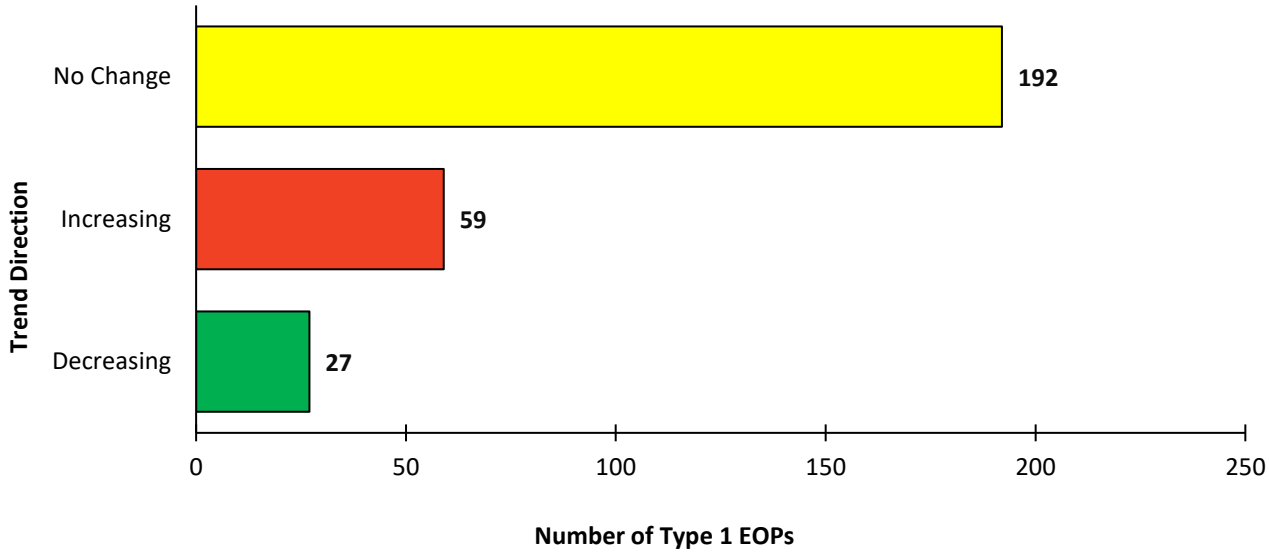

Figure 4-5 Bar graph showing the trend direction for the number of Type-1 EOPs with WWOs for the rolling five-year average totals

Annual portfolio performance

Figure 4-6 presents the annual Type-1 WWO totals for the network from 2017 to 2026, overlaid with a five-year rolling average to illustrate the underlying trend. The data reveals notable year-to-year variability in overflow events, with annual totals ranging from an exceptional peak of 777 WWOs in 2023 to a low of 94 WWOs in 2025. While the annual total increased to 144 WWOs in 2026, it remained substantially below the levels recorded during the period influenced by the significant wet weather events of 2023.

The five-year rolling average, shown from 2021 onwards, provides a clearer picture of the long-term trend by smoothing out annual fluctuations. The rolling average increased from 230 in 2021 to a peak of 309 in 2024, before declining slightly to 290 in 2025 and increasing marginally to 296 in 2026. Although the rolling average remains elevated compared with the 2017-2021 period, recent annual totals indicate a reduction in overflow activity relative to the levels experienced during and immediately following the 2023 peak.

The exceptional spike in 2023 (777 WWOs) represents a significant deviation from the historical pattern and is attributed to the severe wet weather events experienced during that year. This event continues to influence the rolling average in subsequent years. Despite the increase from 94 WWOs in 2024-2025 to 144 WWOs in 2025-2026, the 2025-2026 result remains among the lower annual totals recorded across the reporting period, suggesting that Type-1 WWO occurrence has remained comparatively low relative to historical peak levels.

Site-Specific Performance

Figure 4-7 identifies the top 10 Type 1 sites by total WWO count over the last five-years (2022-2026), with trend classification indicating the trajectory of performance at each location. These 10 sites collectively represent a significant proportion of the network's overflow activity and are therefore priority locations for operational focus and capital investment.

The analysis reveals that increasing trends (shown in green) are evident at seven of the 10 sites: Lake Road (Northcote) WWPS (51 WWOs), Seabreeze WWPS (51 WWOs), Te Atatū North WWPS (45

WWOs), Weiti WWPS (38 WWOs), Black Rock WWPS (36 WWOs), Otara WWPS (36 WWOs) and Tamaki East WWPS (36 WWOs). This represents a larger proportion of sites exhibiting increasing trends than in the previous assessment period and indicates that several of the network's highest-frequency overflow locations continue to experience recurring Type-1 WWO events.

Decreasing trends (shown in red) are observed at Palmer WWPS (44 WWOs) and Cronin WWPS (40 WWOs), suggesting that overflow frequency at these sites has reduced over the assessment period. Western WWPS (35 WWOs) is classified as having no change, indicating relatively stable overflow performance over the five-year assessment period.

Lake Road (Northcote) WWPS and Seabreeze WWPS remain the highest-frequency overflow sites, each recording 51 Type-1 WWOs during the assessment period. Together with Te Atatū North WWPS, Palmer WWPS and Cronin WWPS, these sites account for the largest concentrations of Type-1 overflow activity across the network and should remain priority locations for ongoing monitoring, operational management and targeted investment.

Overall, the predominance of increasing trends among the highest-frequency sites highlights the continued importance of site-specific investigation and intervention programmes to reduce overflow occurrence. At the same time, the decreasing trends observed at Palmer WWPS and Cronin WWPS demonstrate that targeted operational and capital improvements can contribute to reducing overflow frequency at historically problematic locations.

Figure 4-6: Type-1 WWOs annual totals since 2017 overlaid with the five-year rolling average

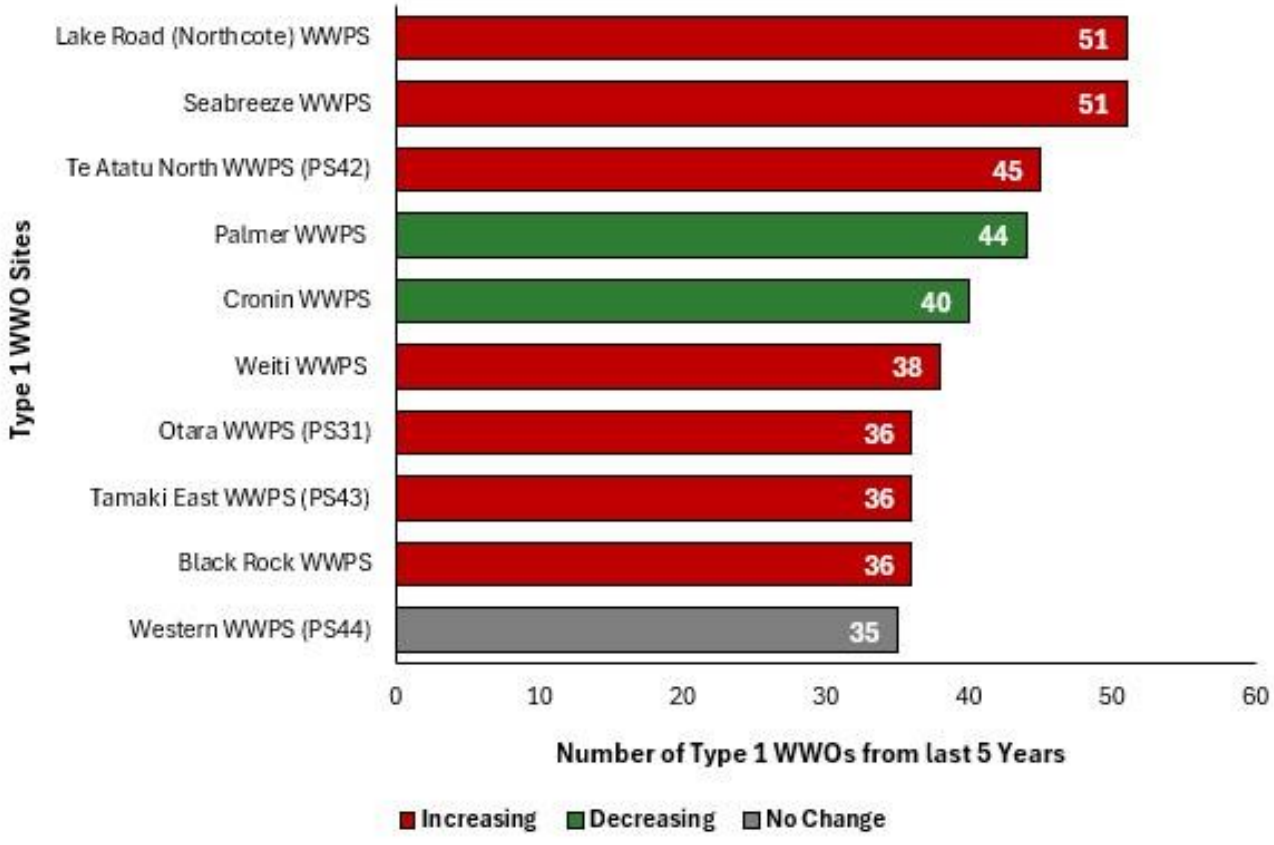

Figure 4-7: Top 10 sites with the total number of Type-1 WWOs in the last five-years, with a trend classification based on five-year (2022-2026) average

4.3.3 Type 2 trends

Type 2 WWOs are alarm-derived and not field-validated as is with all Type 2 alarms. As noted in Section 3.1.2, these data are used to guide risk-based prioritisation rather than to determine consent compliance. The 2025/26 totals indicate a network-level decrease relative to 2024/25, with material variation by catchment and asset. Figure 4-8 to Figure 4-11 referenced below summarise concentration, dispersion, change, and geographic drivers to support targeted management actions.

- The distribution of alarmed events is not tightly concentrated (), although the reporting year 2025-2026 shows greater concentration among the highest-ranked EOPs. The top 15 EOPs accounted for approximately 53% of the 2025-2026 total (236 of 442 events), compared with approximately 45% in 2024-2025. A further cohort comprising EOPs ranked 16–32 brought the cumulative 2025-2026 reporting year share to approximately 80%, compared with ranks 16–38 in 2024-2025. The remaining 20% of 2025-2026 events were spread across 30 EOPs, forming the "long tail".
- The cumulative contribution curve shows how alarms accumulate as additional EOPs are included (Figure 4-9). In 2025-2026, the reporting year 2025-2026, the top 15 EOPs accounted for 53.4% of Type-2 WWO alarms, the top 25 for 70.8%, and the top 32 for 80.3%, compared with approximately 80% across the Top 38 in 2024-2025. This indicates greater concentration among higher-ranked EOPs in 2025-2026, although around half of the 62 EOPs with recorded alarms were still needed to account for 80% of events. These milestones provide an objective reference for resourcing plans by identifying how many EOPs require active management to address a given share of alarms. However, several years of monitoring are needed to determine whether this concentration represents a sustained pattern rather than year-to-year variation.
- Catchment totals for 2025-26 versus 2024-25 highlight where alarm activity is concentrated (Figure 4-10). Hobson Bay remained the highest-contributing catchment in 2025-2026 despite a reduction in Type 2 WWOs from 183 to 148. Henderson Creek increased from 63 to 89 WWOs and became the second highest-contributing catchment, while Western Isthmus decreased slightly from 56 to 51 WWOs. The companion table within Figure 4-10 lists the principal EOP contributors in the top catchments and their year-on-year changes, enabling targeted planning of work orders, inspections, and inflow management. The most notable increases within the highest-contributing catchments occurred at Henderson Creek EOPs 748 and 1604 (+9 overflows each), while Hobson Bay EOP 193 decreased by three overflows.
- Year-on-year deltas separate rising alarm points (red) from improving assets (green) Figure 4-11). Year-on-year deltas separate rising alarm points (red) from improving assets (green) (Figure 4-11). Step-change increases at specific EOPs (e.g. Henderson Creek 748, 1604 and 1653; Cox's Bay 740; Upper Harbour South 844; Warkworth Creek 1540) warrant rapid diagnostics to confirm root cause and prevent persistence. Substantial decreases at others (e.g. Central Auckland CBD 80; Hobson Bay 420, 71 and 561; Western Isthmus (Central Interceptor) 1629; Upper Tāmaki River 1543) are to be verified for consistency with operational interventions and should be protected via light-touch monitoring.

Management implications

- The combination of Figure 4-8 and Figure 4-9 indicates that achieving an ~80% reduction target will require coordinated action across roughly 30 EOPs, not solely the Top 10 or Top 15. This should be reflected in work planning and contractor allocation.

- Figure 4-10 supports catchment-level intervention packages (e.g. Henderson Creek, Hobson Bay, Western Isthmus, Cox's Bay and Warkworth Creek) combining condition assessments, targeted cleaning, defect repair and inflow control at sub-catchment scale.
- EOPs with step-change increases in Figure 4-11 should receive expedited investigation (telemetry checks, blockage screening and local inflow assessments), with interim operational controls applied where feasible to prevent recurrence during wet-weather periods.
- Because Type 2 WWOs are alarm derived, repeated alarms at the same EOP should be selectively field verified to confirm root causes and to screen for telemetry bias or false positives before committing to capital solutions.
- Establish early warning KPIs, including monthly alarm density by catchment and automated "step-change" triggers at the EOP level to escalate response when thresholds are breached. Improving sites identified in Figure 4-11 should be placed on a watchlist to sustain gains.

These insights will inform 2026-2027 prioritisation, balancing targeted asset interventions at high-impact EOPs with catchment-level programmes where alarm density is greatest.

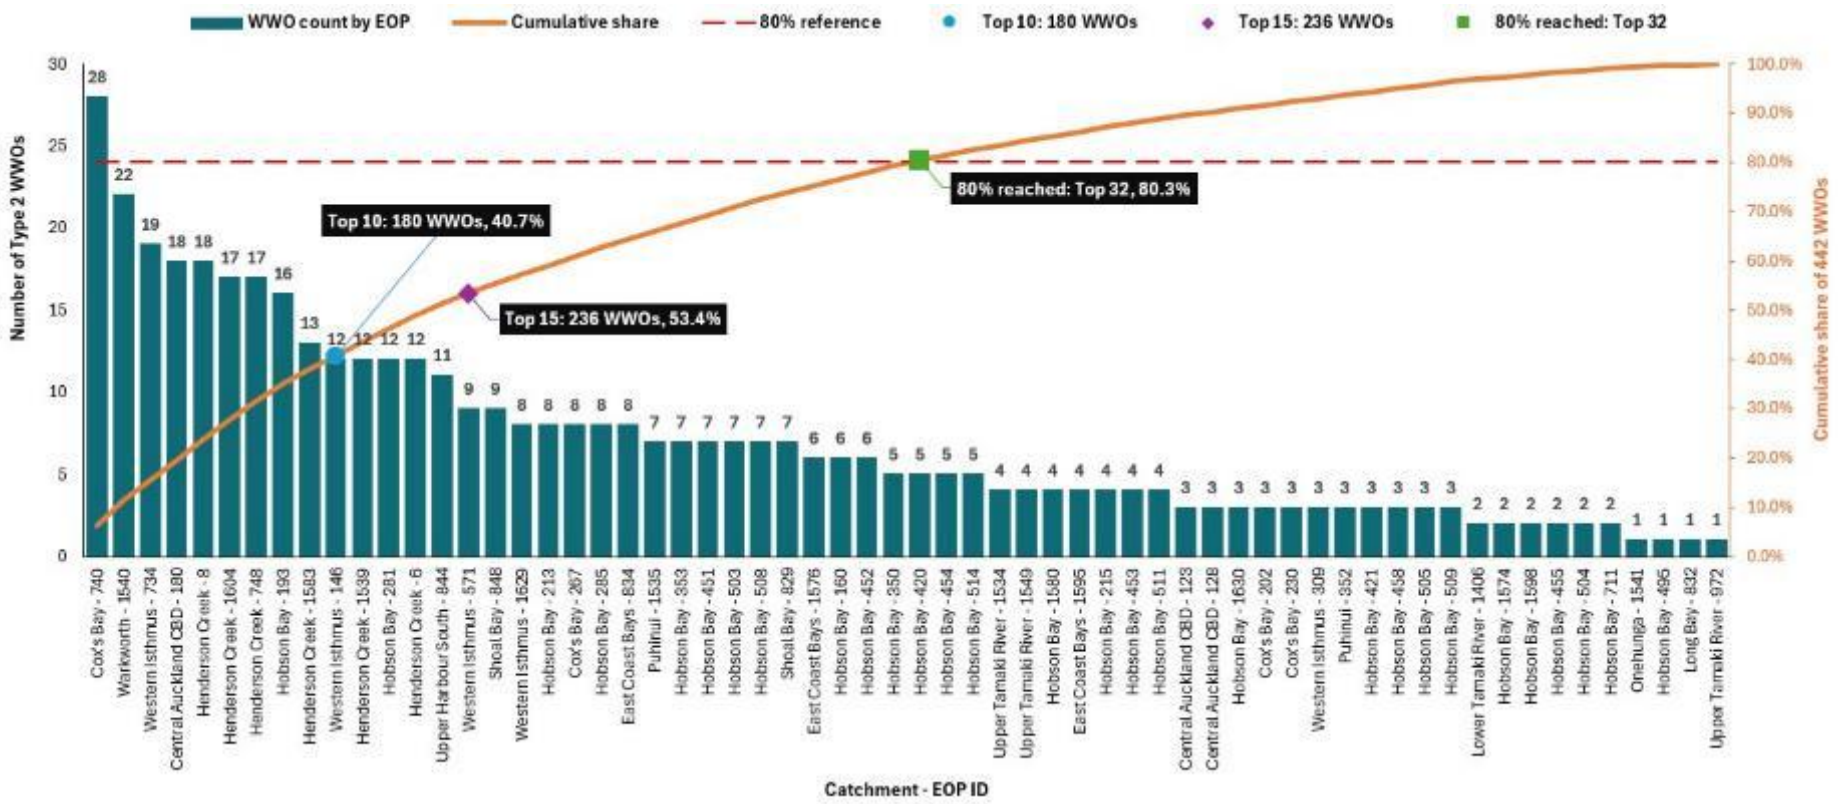

Figure 4-8: Pareto distribution of Type 2 wet-weather overflows by EOP rank. Bars show the WWO count for each of the 62 EOPs and the line shows the cumulative proportion of 442 qualifying WWOs. The Top 15 EOPs contributed 236 WWOs (53.4%); the 80% threshold was reached at the Top 32 EOPs (355 WWOs; 80.3%); and the remaining 30 EOPs contributed 87 WWOs (19.7%), indicating moderate concentration with a diffuse long tail (Gini = 0.416)

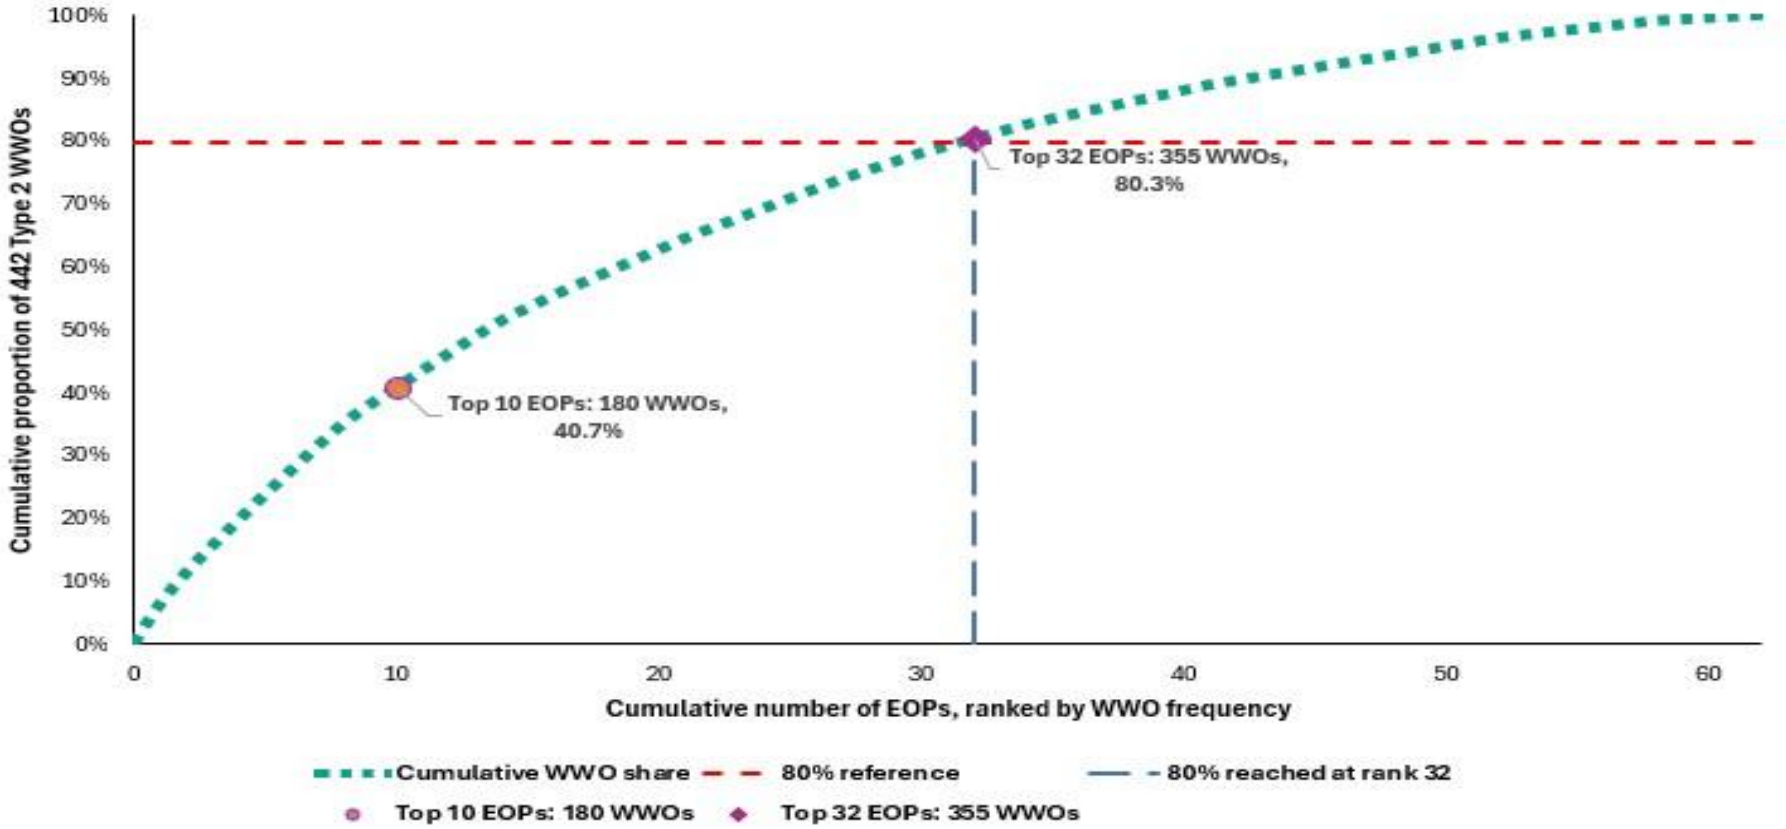

Figure 4-9: Cumulative Type 2 WWOs versus EOP rank, showing the Top 10 contribution and the ~80% threshold (Top 32); quantifies the dispersion of WWOs across EOPs

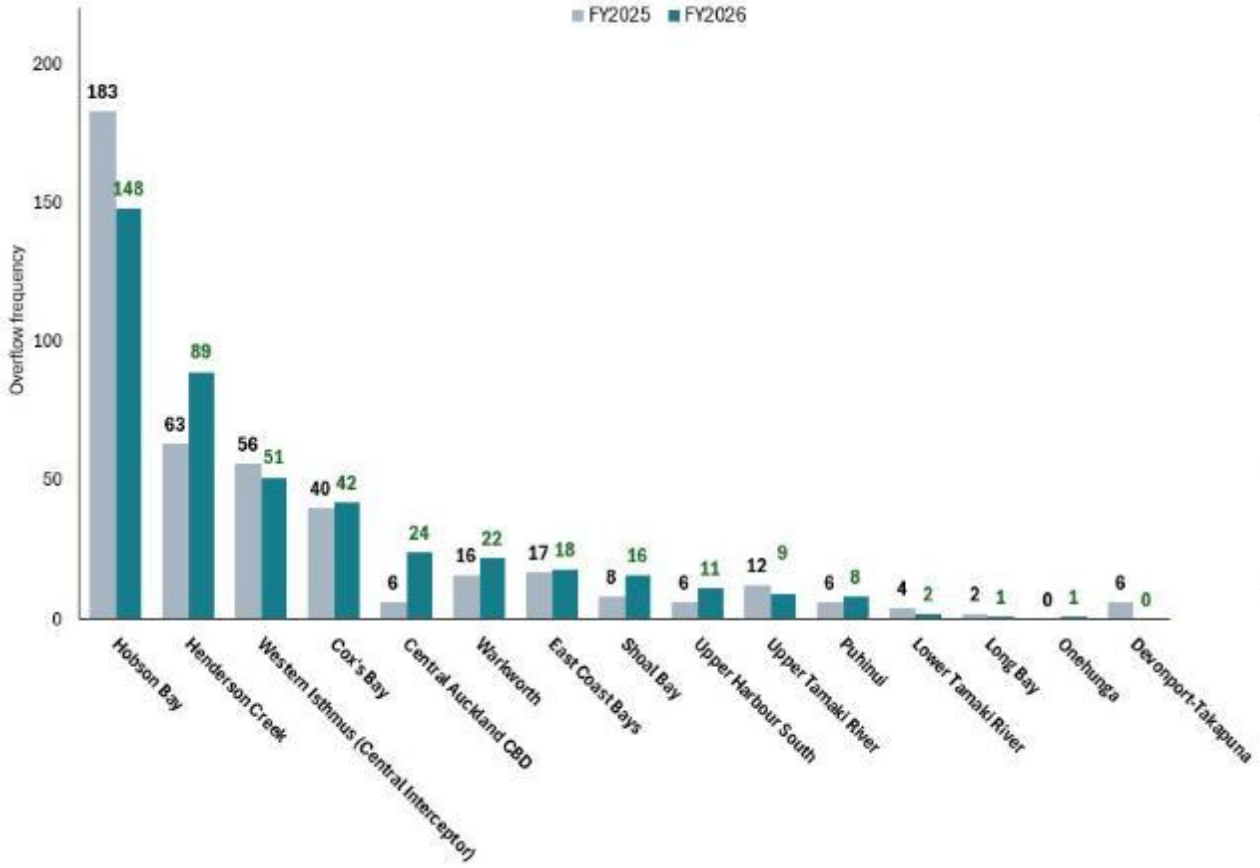

Catchment	EOP ID	FY2025	FY2026	Δ
Hobson Bay	193	19	16	-3
Hobson Bay	281	11	12	1
Hobson Bay	213	8	8	0
Henderson Creek	8	18	18	0
Henderson Creek	748	8	17	9
Henderson Creek	1604	8	17	9
Western Isthmus	734	15	19	4
Western Isthmus	146	8	12	4
Western Isthmus	571	11	9	-2

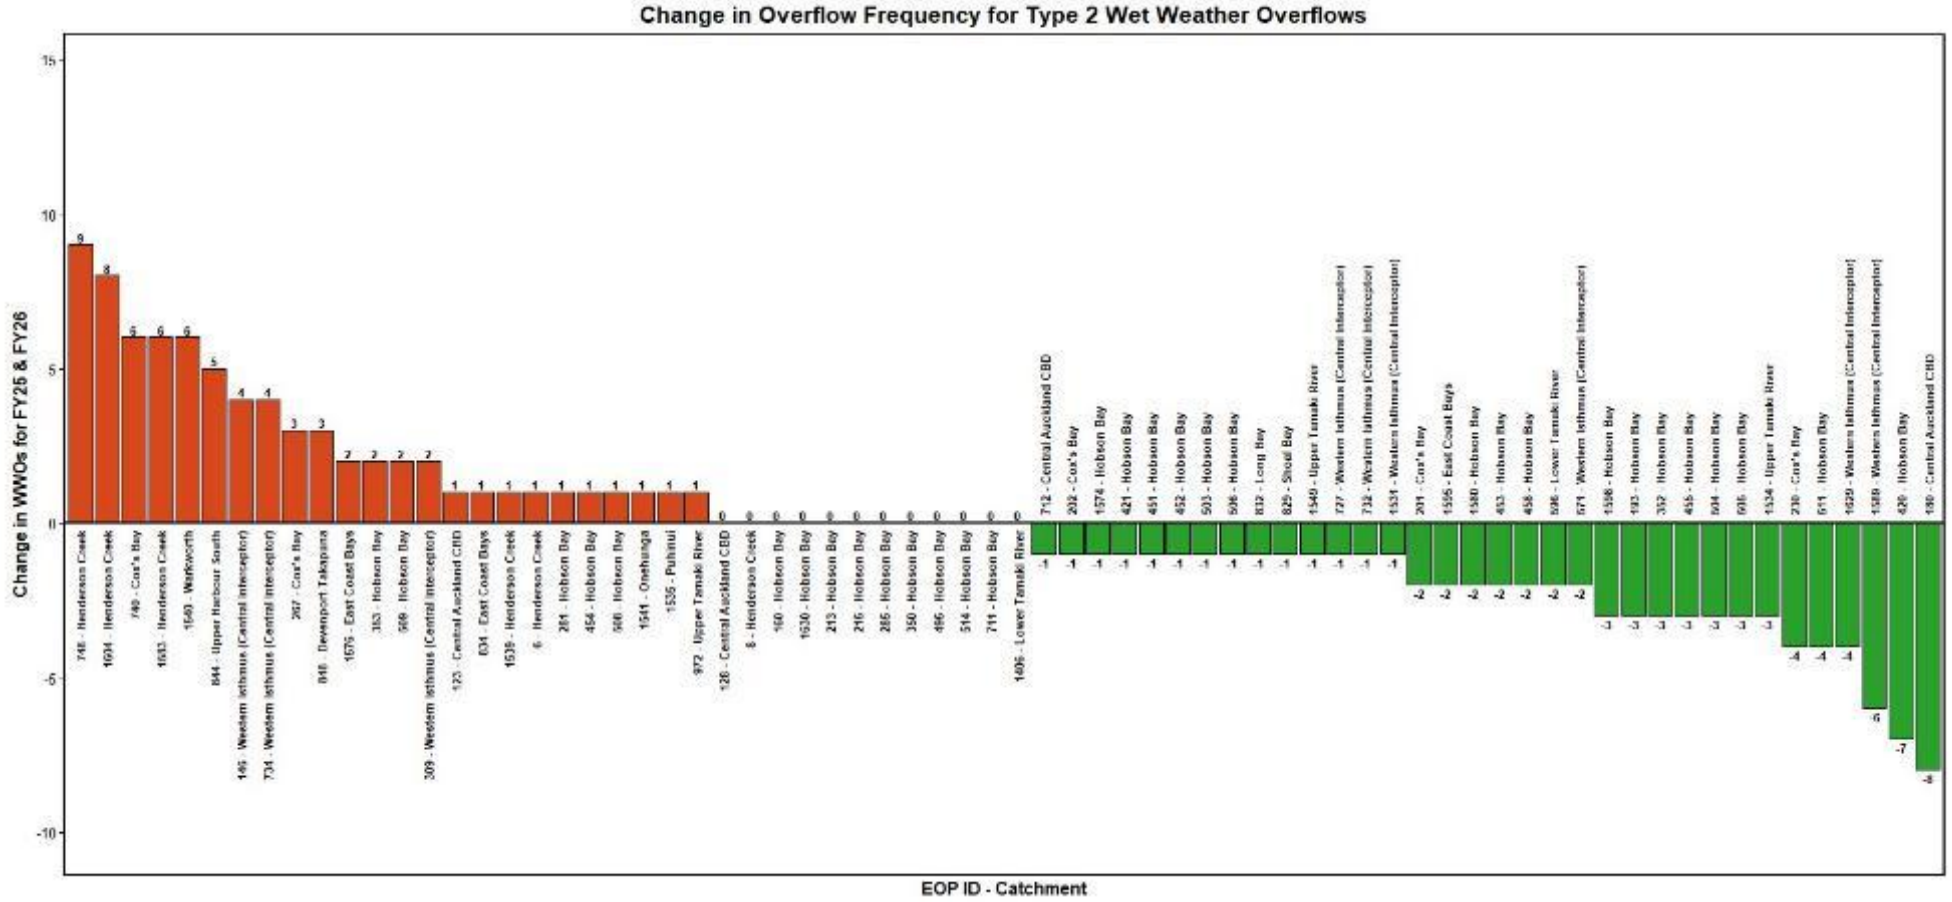

Figure 4-11: Change in Type-2 WWOs from 2024/25 to 2025/26 at each EOP (red↑, green↓), highlighting step-change risers and improving assets

4.3.4 Type-3 trends

Total frequencies of overflow cause across the Auckland region over the past five financial years are presented in Figure 4-12. This section presents a statistical analysis of WWOs across the network for 2021-2022 to 2025-2026. Linear regression analysis was conducted on annual overflow counts by cause category to identify statistically significant trends, with significance assessed at $p<0.05$ and emerging trends noted at $p<0.10$.

Key findings

- Total of 5,927 Type-3 WWOs recorded over the five-year period. Annual Type 3 WWO counts across the Auckland region, excluding third-party damage, were 798 in 2021-2022, 2,312 in 2022-2023, 828 in 2023-2024, 952 in 2024-2025 and 1,037 in 2025-2026
- 2022-2023 is the five-year peak at 2,312 WWOs, an increase of 190% from 2021-2022. Counts fell 64% in 2023-2024, then rose 15% in 2024-2025 and 8.9% in 2025-2026. 2025-2026 remains 55.1% below the 2022-2023 peak but is 29.9% above 2021-2022.
- The post peak reduction has therefore not been maintained as a continuing downward trend; annual counts have increased since 2023-2024
- None of the ten cause categories showed a statistically significant linear trend or met the emerging-trend threshold over 2021-2022 to 2025-2026; all p-values were ≥0.10.
- Surcharging/Heavy Rain accounted for 3,076 Type-3 WWOs (51.9%) over FY2022–FY2026. Annual counts were 479, 1,535, 284, 277 and 501, respectively. The estimated trend was not statistically significant ($\beta = -121.40$ events/year; $p = 0.545$).
- For 2025-2026 only, the Surcharging/Heavy Rain category includes 206 originally recorded surcharging events, 279 Unknown events and 16 Broken Pipe events, totalling 501 events (48.3% of FY2026 WWOs). Earlier years retain their original classifications. This reporting change limits direct year-to-year comparison and does not establish a confirmed physical cause.
- Unknown accounted for 1,112 events (18.8%), all from 2021-2022 to 2024-2025 reporting years. Its separately reported 2025-2026 count is zero because of reclassification, not an absence of events. Unknown Blockage remains separate, with 171 events in 2025-2026, and is not assessed as a five-year trend because the category was introduced that year.
- Silts and Power Failure met neither the significant nor emerging-trend criteria. Their estimated slopes were +1.60 WWOs/year ($p = 0.292$) and +1.70 WWOs/year ($p = 0.358$).
- Traditional blockage causes- Fats, rags and roots showed no statistically significant linear trends, with p-value of 0.162, 0.207 and 0.574.

Methodology

Linear regression was performed on the five annual WWO counts for each standardised cause category, including years with zero events. Annual frequencies were calculated by summing the source Count field for WWO records, grouped by financial year and cause. The regression slope (β) represents the estimated annual change in WWO frequency. Statistical significance was assessed using a two-sided t-test with three residual degrees of freedom.

Significance criteria:

- $p<0.05$: Statistically significant trend
- $p<0.10$: Emerging trend requiring monitoring
- $p\geq0.10$: No significant trend detected

- β (Beta coefficient): Rate of change per year (positive = increasing, negative = decreasing)

The analysis was conducted in accordance with standard statistical practices for environmental compliance reporting and aligns with the methodology used in previous annual reports. The full summary output of the analysis can be found in Appendix F.

The 2023 extreme weather events (Auckland Anniversary Weekend flooding and Cyclone Gabrielle) created a significant outlier in the dataset. While this event is included in the statistical analysis, interpretation of trends must account for this anomalous year. The analysis examines both the overall five-year trend and the recovery pattern post-2023.

Overall network performance

Following the 2022-2023 reporting years extreme-weather peak, Type 3 WWO frequency reduced substantially in 2023-2024. However, this reduction has not been sustained, with annual overflow frequency increasing in both 2024-2025 and 2025-2026. The 2025-2026 result continues this post-2023-2024 upward pattern and represents the highest annual count outside the anomalous 2022-2023 year over the five-year analysis period.

When the 2022-2023 anomaly is considered separately, the overall pattern indicates a gradual increase in Type 3 WWO frequency. By 2025-2026, annual overflow frequency had exceeded 2021-2022 levels, suggesting that the network has not returned to the lower frequency observed at the beginning of the analysis period. Although the increases following 2023-2024 are considerably smaller than the 2022-2023 spike, two consecutive years of increasing frequency warrant continued monitoring to determine whether this reflects normal year-to-year variability or a developing longer-term pattern.

Figure 4-12 and Figure 4-13 present the annual Type 3 WWO frequency and corresponding year-on-year changes.

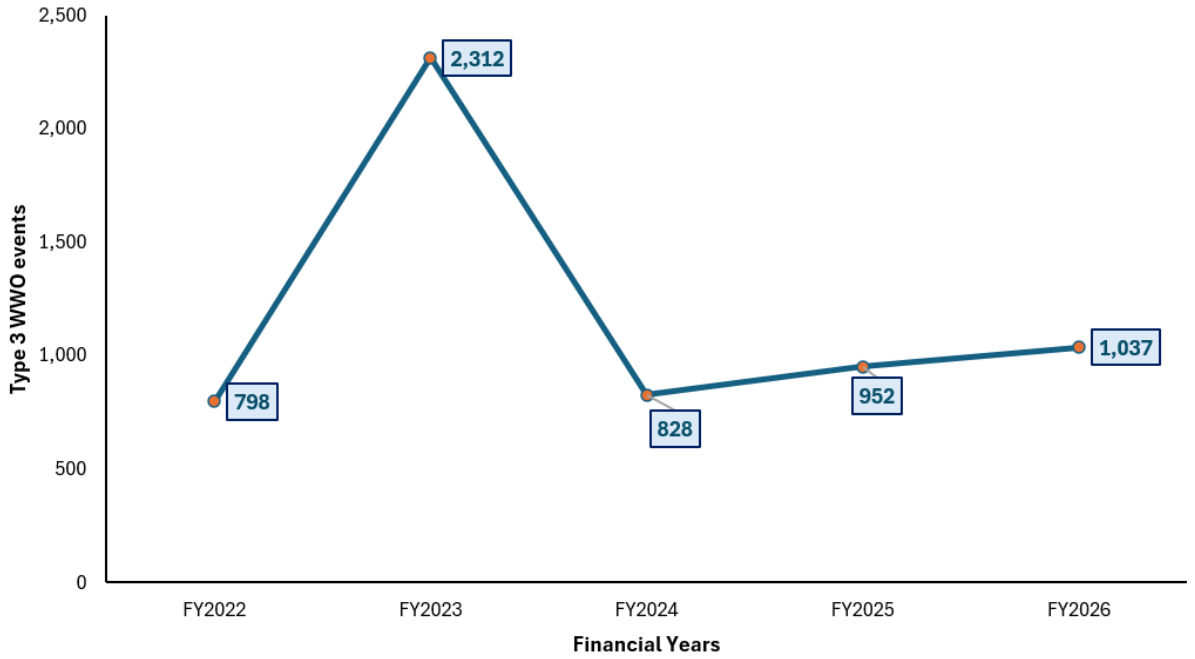

Figure 4-12: Total Type-3 WWOs from 2022 to 2026

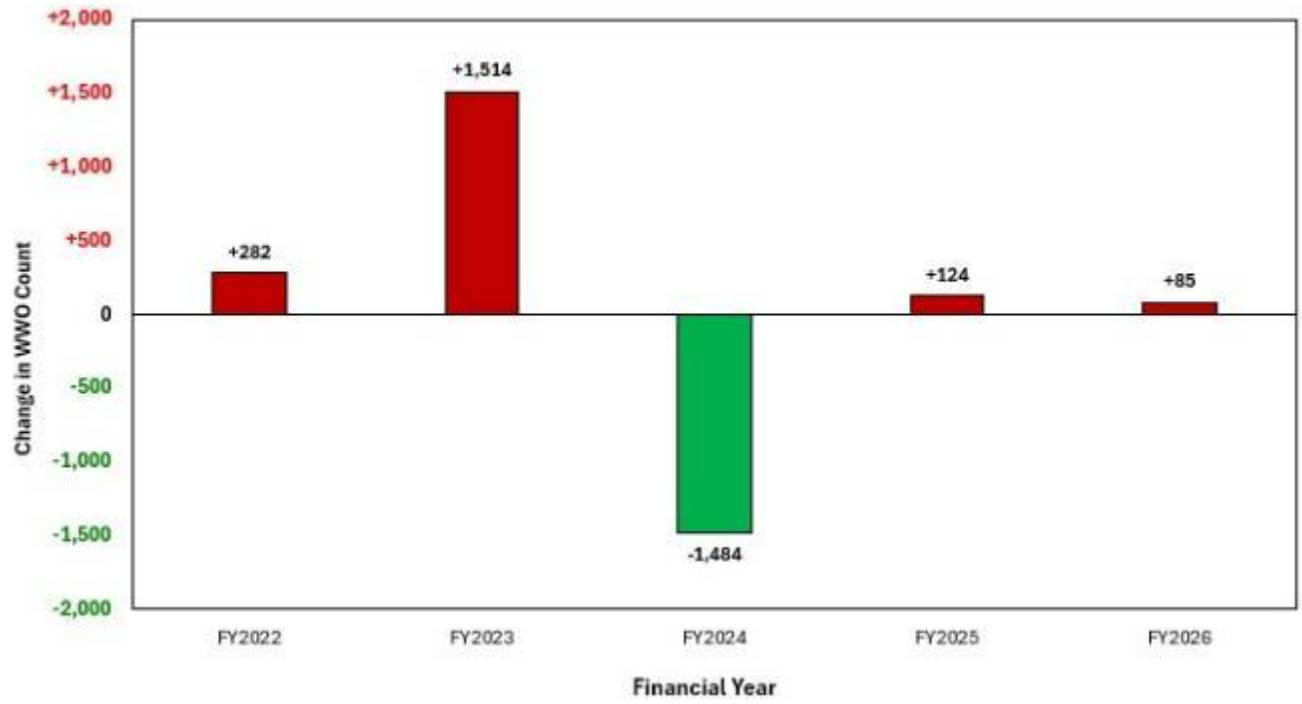

Figure 4-13: Year-over-Year change in total Type 3 WWOs from reporting year 2021-2022 to 2025-2026

Cause-specific analysis

The five most frequent recorded causes of Type-3 WWOs (Figure 4-15) over 2021-2022 to 2025-2026, excluding third-party damage, are:

- Surcharging/Heavy Rain: 3,076 events (51.9%) — The dominant reporting category; rainfall and capacity contributions require event-level assessment.
- Unknown: 1,112 events (18.8%) — Recorded in FY2022–FY2025, highlighting the importance of improving cause identification and investigation.
- Roots: 556 events (9.4%) — A recurring cause supporting targeted asset inspection and root-management measures.
- Fats: 516 events (8.7%) — Supporting consideration of appropriate-disposal education and trade waste investigations.
- Unknown Blockage: 171 events (2.9%) — Recorded separately in FY2026, warranting further investigation to identify blockage materials or mechanisms.

  For 2025-2026 only, 279 Unknown and 16 Broken Pipe events are included in Surcharging/Heavy Rain. Earlier years remain unchanged. This reporting classification limits comparability and does not establish a confirmed physical cause. Rags, with 159 events (2.7%), is now the sixth-largest category.

  Together, these five categories account for 5,574 events (94.0%) of the 5,927 included Type-3 WWOs. They provide a basis for prioritising investigation and targeted prevention, although the counts alone do not quantify potential network performance improvements. Refer to Figure 4-14 for annual Type-3 WWO frequencies by top 7 cause over 2021-2022 to 2025-2026.

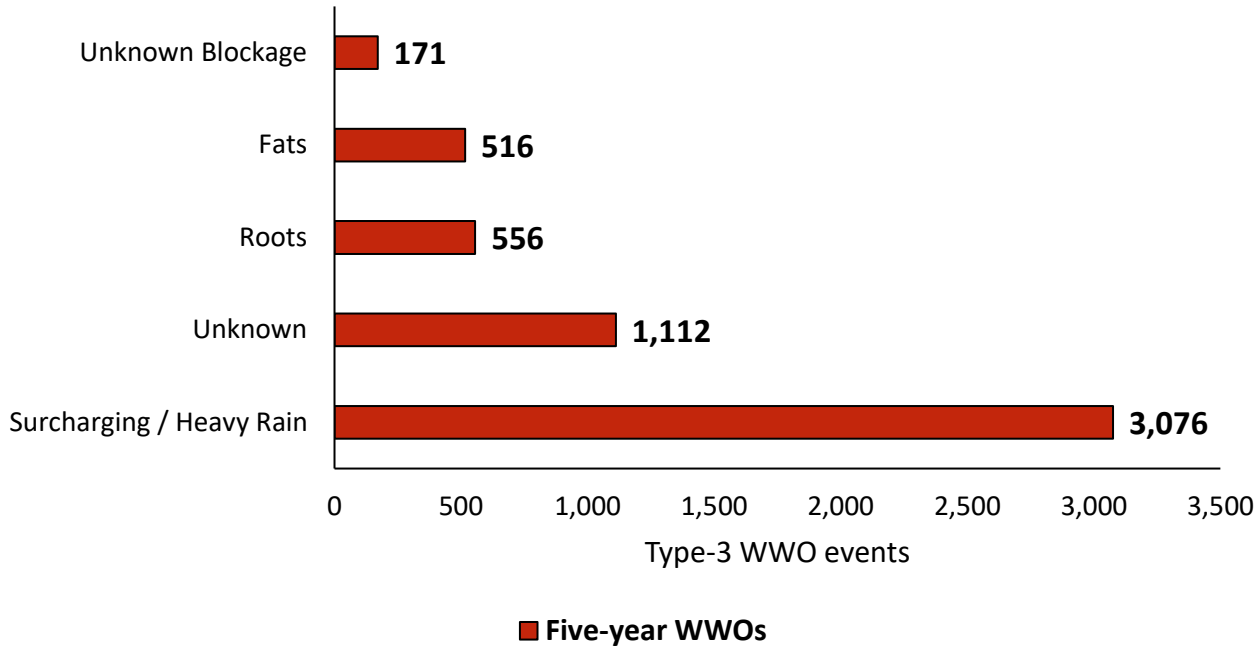

Figure 4-14: Top 5 causes of Type- 3 WWOs (2022-2026)

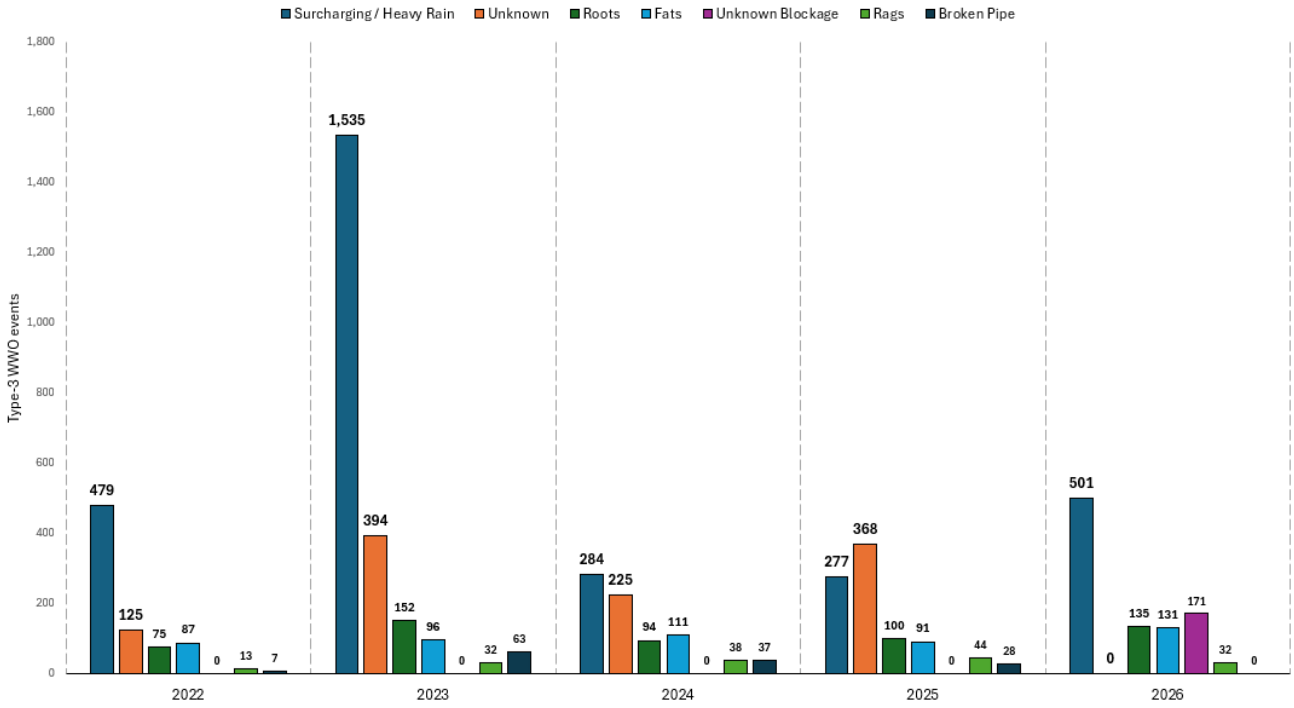

Figure 4-15: Bar graph showing the number of Type-3 WWOs per year for the period 2022-2025 for the top 7 causes

Statistically non-significant trends

Linear regression analysis identified no statistically significant trends ($p<0.05$) or emerging trends ($0.05 \leq p<0.10$) among the ten established cause categories over 2021-2022 to 2025-2026.

Surcharging remained the largest recorded cause of Type-3 WWOs, accounting for 2,781 events (46.9%). Its fitted trend was negative but not statistically significant ($p=0.377$, $\beta=-180.40$ events/year). Annual counts were 479, 1,535, 284, 277 and 206, respectively. The pronounced 2022-2023 peak influences the regression result. The absence of statistical significance does not establish stable performance, and the model does not adjust for rainfall or weather variability. Refer to Figure 4-18 for annual surcharging counts.

Blockage-related causes like Fats, Rags and Roots collectively accounted for 1,231 WWOs (20.8%). None showed a statistically significant or emerging linear trend:

- Fats: 516 events, with $p=0.162$ and $\beta=+8.30$ events/year. Annual counts were 87, 96, 111, 91 and 131. 2025-2026 recorded the highest count in the period, increasing 44.0% from 2024-2025. This recent increase warrants investigation but does not by itself establish changes in trade waste compliance or public behaviour.
- Rags: 159 events, with $p=0.207$ and $\beta=+5.00$ events/year. Counts increased from 13 in 2021-2022 to 44 in 2024-2025, before falling to 32 in 2025-2026. Appropriate-disposal practices remain a potential focus for investigation and prevention, rather than a demonstrated explanation for the annual pattern.
- Roots: 556 events, with $p=0.574$ and $\beta=+6.80$ events/year. Annual counts were 75, 152, 94, 100 and 135. The 2025-2026 reporting year increase warrants continued monitoring, although these counts alone cannot establish weather effects or the effectiveness of pipe renewal and root-management programmes. Refer to Figure 4-17 for blockage-related trends

Infrastructure failure – Broken Pipe: The 16 Broken Pipe events in FY2026 are included in Unknown and are not reported separately, avoiding double-counting. Broken Pipe counts for the reporting years 2021 2022 to 2025-2026 remain unchanged at 7, 63, 37 and 28, respectively. A separate five-year Broken Pipe trend is not presented because the 2025-2026 grouping differs from earlier years. Continued asset-level review remains appropriate, but these counts alone do not establish asset deterioration or a sustained network-wide trend.

Unknown: Unknown accounted for 1,391 events (23.5%), making it the second-largest recorded cause. Its positive five-year slope was not statistically significant ($p=0.495$, $\beta=+28.20$ events/year). Annual counts were 125, 394, 225, 368 and 279.

Events recorded as Unknown decreased from 368 in 2024-2025 to 279 in 2025-2026 which was a reduction of 24.2%. The introduction of the separate unknown blockage category may have contributed to this reduction by enabling more specific cause identification. It should therefore not be interpreted solely as a reduction in overflow occurrence. Unknown Blockage is excluded from the Unknown total and regression. Refer to Figure 4-20 for unknown trends.

The remaining Unknown events warrant review of:

- Overflow investigation procedures and root-cause analysis resourcing.
- Field staff training and diagnostic capabilities.
- CCTV and inspection equipment deployment.
- Data recording and classification systems.
- Post-event investigation resourcing.

These are areas for review, not confirmed explanations for the Unknown classifications.

With only five annual observations per established cause, the tests have limited statistical power. A non-significant result does not demonstrate no change. Full updated regression output is retained in T3 WWO 2025-2026 Trend Check for inclusion in Appendix E.

Management implications

Watercare operations will look into these potential issues in future including Implementing enhanced overflow investigation protocols and consider additional training for field staff in root cause assessments.

Cause distribution analysis

The 2023 extreme weather events (Auckland Anniversary Weekend flooding and Cyclone Gabrielle) resulted in 2,326 Type 3 WWOs—a 290% increase from 2022. Analysis of the cause distribution during this extreme year provides insights into network vulnerabilities under severe weather conditions.

2023 Cause distribution

- Surcharging: 1,535 events (66.0%) - Overwhelmingly dominant during extreme rainfall
- Unknown: 394 events (16.9%) - Investigation challenges during emergency response
- Roots: 152 events (6.5%) - Exacerbated by saturated ground conditions
- Fat: 96 events (4.1%) - Continued despite extreme weather focus
- Broken pipe: 63 events (2.7%) - Increased structural failures under stress
- Rags: 32 events (1.4%) - Relatively lower proportion during high-flow conditions

The 2023 distribution shows that surcharging increased from 48.6% of WWOs (five-year average) to 66.0% during extreme weather, confirming that hydraulic capacity exceedance is the primary vulnerability during severe rainfall events (Figure 4-19).

The 2024 cause distribution (836 total WWOs) demonstrates network recovery post-extreme weather, with cause proportions returning closer to historical norms. This year represents the first full year of post-event recovery and provides a baseline for assessing ongoing network performance.

The 2025 cause distribution (955 total WWOs) shows continued stable performance with cause proportions consistent with pre-2023 patterns. The modest 14% increase from 2024 is within normal year-to-year variability and does not indicate systemic deterioration.

The 2025-2026 cause distribution (1,037 Type-3 WWOs, excluding third-party damage) shows an 8.9% increase from 2025-2026. Unknown remained the largest cause (26.9%), followed by Surcharging (19.9%). Unknown events decreased by 24.2%, potentially aided by the introduction of

the separate Unknown Blockage category (171 events; 16.5%). Surcharging declined, while Roots and Fats increased, warranting continued monitoring of blockage-related causes.

Catchment-specific analysis

The top 5 catchments which are Henderson Creek, Upper Tamaki River, Western Isthmus (Central Interceptor), East Coast Bays and Whau River accounted for 50.3% of Type-3 WWOs (2,983 of 5,927 events) over the 2021-2022 to 2025-2026 reporting years, excluding third-party damage (Figure 4-16). These catchments warrant prioritised investigation, targeted interventions and assessment of investment needs. Table 4-8 presents annual counts for the ten leading catchments, while Figure 4-17 shows cause-specific patterns in the top three.

Upper Harbour North recorded a statistically significant decline in Surcharging over 2021-2022 to 2025-2026 financial year, falling from 16 to 2 events (45 events overall; p=0.049). This is the only significant trend highlighted here because it involved a larger event total than the increases in Pukekohe Fats (12 events) and Hobson Bay Silts (6 events). Those lower-volume results remain statistically significant but are not emphasised in this summary. Ten emerging trends were also identified; Unknown and Unknown Blockage were excluded from testing because of the 2025-2026 classification change.

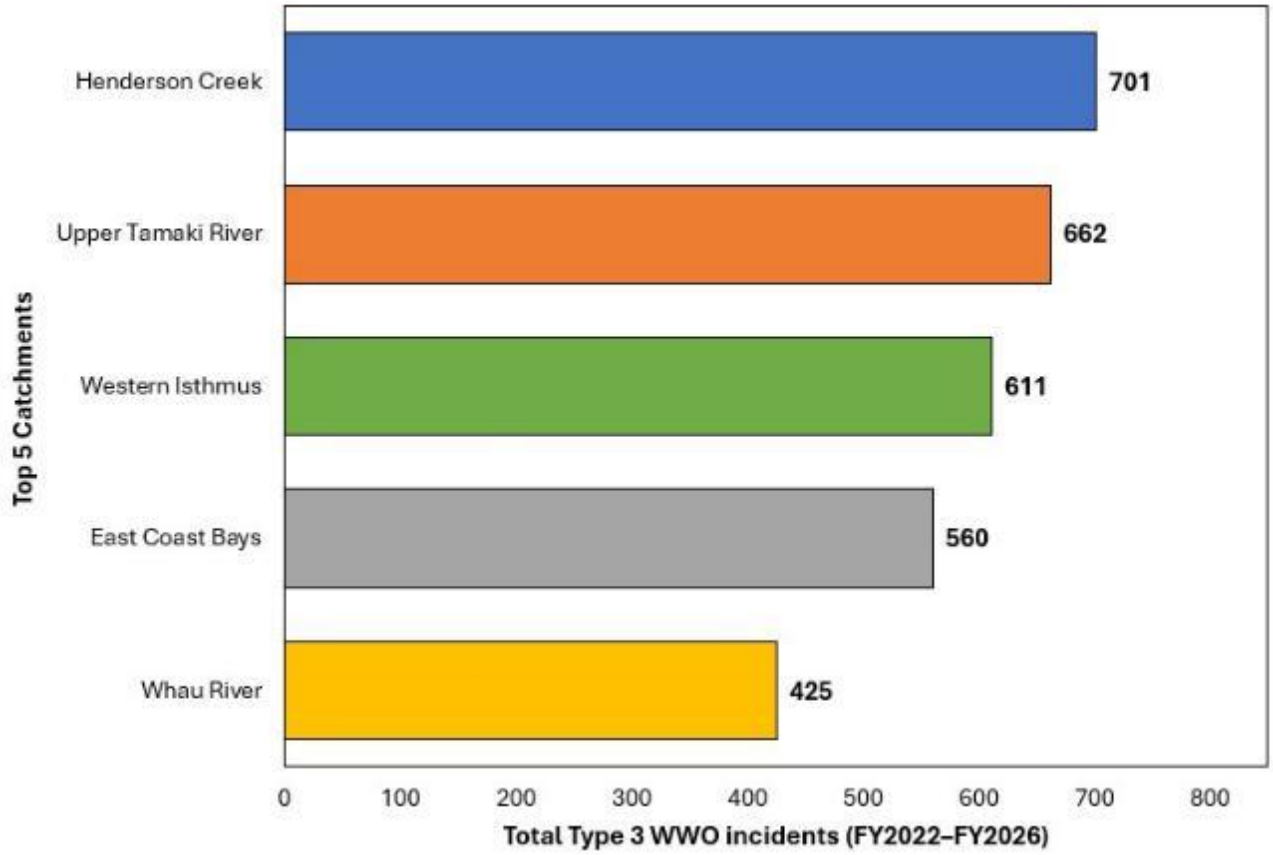

Figure 4-16: Top 5 Catchments by total Type-3 WWOs (2021-2026)

Table 4-8 ***Top 10 catchments with highest total Type-3 WWOs from 2022 to 2026***

Catchment	2022	2023	2024	2025	2026	Total
Henderson Creek	82	301	101	97	120	701
Upper Tamaki River	86	215	114	100	148	663
Western Isthmus (Central Interceptor)	119	247	64	100	98	628

Pahurehure Inlet	Fats	+1.50	0.0939	0.662
Mangere	Fats	+2.10	0.0965	0.656

Summary Type-3 WWOs trends

The five-year analysis for 2021-2022 to 2025-2026, excluding third-party damage, identified no statistically significant ($p<0.05$) or emerging ($0.05 \leq p < 0.10$) linear trends among the ten established cause categories, including Silts and Power Failure. 2025-2026 recorded 1,037 WWOs, an 8.9% increase from 2024-2025. Although below the 2022-2023 peak, counts have increased since 2025-2024 and do not demonstrate a sustained return to baseline.

Surcharging remained the dominant recorded cause over the five years (46.9%), supporting continued attention to hydraulic capacity. Unknown accounted for 23.5%, highlighting opportunities to improve cause investigation. The separate Unknown Blockage category introduced in 2025-2025 (171 events) should be considered when comparing annual cause distributions.

Catchment-level analysis identified three significant trends; two increasing, one decreasing and nine emerging trends, supporting targeted investigation. Unknown and Unknown Blockage were excluded from these catchment tests because of classification changes. Findings remain exploratory because several involve low counts, only five annual observations were available, and tests were not adjusted for multiple comparisons.

Overall, the data supports continued focus on hydraulic capacity, blockage prevention and cause identification. Annual counts alone do not substantiate a “normal to medium” network performance rating or establish resilience, deterioration or climate-related effects.

4.3.5 Capacity improvement projects

A coordinated programme of wastewater infrastructure upgrades continues to be delivered across Auckland to address capacity constraints, improve network resilience, support population growth, and reduce wastewater overflows. Key projects related to overflow mitigation are progressing across several high-priority catchments, with a number expected to be completed between 2026 and 2028. The main improvement projects related to wastewater overflow mitigation are briefly discussed below but are detailed in Section 6.

Within the Western Isthmus, the Central Interceptor remains the most significant wastewater infrastructure investment and is expected to substantially improve network performance and overflow outcomes across multiple catchments. Supporting projects delivered through the Western Water Quality Improvement Programme (WWQIP) are also progressing, including the Herne Bay Wastewater Branch 5 Upgrade, scheduled for completion in 2028, and the Avondale Whau CC7A and CC7A1 project, expected to be completed in 2029. The Unitec Wastewater Diversion is expected to be completed in 2026 and will reduce overflows to Oakley Creek. Longer-term projects, including the Motions Catchment Improvement Works, will continue to deliver additional overflow reduction benefits through the early 2030s.

Within the Henderson Creek catchment, the Northern Interceptor remains the primary capacity improvement project. Stage 1 will increase conveyance capacity, support growth in the northwest, and reduce overflows through the diversion of flows away from constrained wastewater infrastructure. The Whenuapai and Redhills Wastewater Servicing project, which includes Northern Interceptor Stage 2, is scheduled for completion in 2029 and will further support growth and overflow reduction. Additional stages of the Northern Interceptor are planned through the 2030s and will provide further long-term benefits to wastewater performance in the catchment.

Within the East Coast Bays catchment, several projects are expected to improve conveyance capacity and reduce wastewater overflows. The Mairangi Bay Gravity Wastewater Sewer Upgrade and the Wairau Valley Branch Trunk Sewer Renewal are both expected to be completed in 2028 and will improve network performance and resilience. The Northcote-Chatswood Wastewater Network Upgrades are also due for completion in 2028 and will provide additional capacity through new pumping and conveyance infrastructure. Longer-term projects, including the Wairau Valley Diversion

and Forrest Hill Wastewater Catchment Diversion, will provide substantial future benefits as they are delivered over the coming decade.

Within the Upper Tāmaki catchment, the Ōtara Catchment Wastewater Capacity Upgrades are expected to be completed in 2028 and will increase storage and pumping capacity within the network. The Howick Wastewater Catchment System Upgrades remain a major long-term project that will improve network capacity and support overflow reduction through the diversion of wastewater flows towards the Tāmaki Interceptor.

Additional projects are progressing across other catchments where overflow reduction benefits are expected. These include the Archboyd Avenue Pump Station and Associated Pipelines project and the Dunkirk Stage 2 Rising Main project, both expected to be completed in 2028, as well as the Castledine Catchment Diversion to the Eastern Interceptor, also scheduled for completion in 2028. These projects will increase network capacity, improve resilience, and reduce overflow risks within the Māngere and Lower Tāmaki catchments.

While these projects are expected to improve wastewater network performance and reduce overflows, benefits will be realised progressively as works are completed. Consequently, improvements are expected to be phased and catchment-specific rather than immediate and network-wide.

5 INFLOW AND INFILTRATION

5.1 Introduction

This chapter describes the I&I reduction programme for the 2025-2026 reporting period. The focus of the I&I programme is to work closely and collaboratively with the Auckland Council HW Safe Networks and Watercare Network Service Delivery teams to identify sources of rainfall derived inflow and infiltration (RDII) and groundwater infiltration (GWI) to the wastewater network that lead to wastewater overflows and discharges to the environment. The emphasis continues to be on the more frequent overflow sites, and those with larger volume discharges, with added emphasis on wastewater overflows to private property and sensitive receiving environments.

5.2 Programme summary

The Inflow and Infiltration Programme comprises four separate bodies of work:

- Watercare's Inflow and Infiltration investigations
- Joint Watercare and Auckland Council's Healthy Waters Safe Networks investigations
- Joint Watercare and Healthy Waters Western Isthmus Water Quality Improvement Programme (WIWQIP)
- Joint Watercare and Healthy Waters Eastern Isthmus Water Quality Improvement Programme (EIWQIP)

5.2.1 Watercare's inflow and infiltration investigations

Investigations are aimed at identifying and removing sources of inflow and infiltration in separated wastewater networks experiencing frequent overflows. Prioritization of investigation areas is given to overflows impacting private properties, waterways, beaches and other coastal areas and where detailed models have predicted high levels of inflow and infiltration.

Investigations generally begin with a comprehensive investigation of all private drainage within the catchment to identify and remove sources of inflow and infiltration. The next phase, where required, includes targeted investigations of public drainage within the catchment. The scope and extent of public investigations will vary depending on the specific catchment characteristics. Some examples of targeted public investigations are inspections of public manholes, CCTV inspections and investigations to determine if stormwater backflow is occurring via unprotected EOPs.

Enhanced network monitoring

The I&I Programme will soon be benefiting from Watercare's Smart Network Programme which is currently being rolled out. The Smart Network Programme includes the installation of 5000 wastewater level sensors in public manholes across the Auckland region and will utilize AI for analysis of the data. This financial year 4500 wastewater level sensors have been installed. The data from the sensors will be used to improve prioritisation and enable more targeted investigations.

Optimizing wastewater pump station controls in response to I&I

Where available, monitored points within the wastewater network are assessed to determine if modifications to pump station controls could improve overall network performance. Analysis of several of our network wastewater pump stations showed that there was the potential to convey

excessive amounts of wastewater downstream early into a wet weather event when the upstream network was still coping well. Assessments are undertaken to determine if utilising available storage (where available) could improve overall network performance.

5.2.2 Safe Networks investigations

Where water quality issues consistently pose a risk to public health in watercourses and at beaches, as indicated by Auckland Council's Safeswim programme, or from other prioritised sites, the Healthy Waters Safe Networks team monitors and investigates to identify and track contaminants to their source.

When contaminant sources are confirmed to be derived from human waste, Watercare and Auckland Council's Healthy Waters Safe Networks and Compliance teams collaborate and inspect private and public drainage networks to diagnose, fix or advise on appropriate target interventions to improve the health of our local waterways and beaches. Investigations are also classified as either reactive and planned, depending on the urgency and complexity of the need being addressed and scoped.

5.2.3 WIWQIP and EIWQIP separation investigations

The Western Isthmus Water Quality Improvement Programme (WIWQIP) and Eastern Isthmus Water Quality Improvement Programme (EIWQIP) continue to progress targeted stormwater separation investigations and projects to reduce stormwater entering the combined wastewater network, reduce wet-weather wastewater overflows and improve water quality outcomes.

In the Western Isthmus the Central Interceptor and proposed collector sewers will improve transmission capacity and alleviate the high frequency combined sewer overflow discharges. Targeted separation remains an important complementary part of the solution in locations where the Central Interceptor and collector sewer network do not provide the full solution. Separation investigations are being used to identify opportunities to remove stormwater from the combined network, reduce wet-weather overflow frequency and volumes, provide additional network capacity and support the performance of planned wastewater infrastructure.

Key Healthy Waters separation projects progressed during FY26 include:

- WIWQIP – Waterview Inlet: Waterview Separation Project Stage 2.2A
- Construction of the Waterview Stormwater Separation Stage 2.2A package is nearing completion. The project includes approximately 500 m of new public stormwater network, enabling private property drainage separation in Fir Street, Middlesex Street and Alverston Street. The work will help reduce wet-weather wastewater overflows to Waterview Inlet and reduce flood risk to properties. Design and consenting for further separation within the Stage 2.1A area is also nearing completion.
- WIWQIP – Oakley Creek: Oakley/Bollard Avenue Separation Project
- The Oakley/Bollard Avenue Stormwater Separation Project was completed during FY26. The project delivered approximately 500 m of new public stormwater network and private drainage separation for 61 properties. The works reduce stormwater entering the wastewater network and associated wet-weather wastewater overflows to Oakley Creek from EOP 440 at 3 Waitati Place.
- WIWQIP – Whau Creek: Blockhouse Bay Separation Project

- The Blockhouse Bay Stormwater Separation Project was completed during FY26. The project delivered approximately 940 m of new public stormwater network and private drainage separation for 28 properties. The works reduce stormwater entering the wastewater network and associated wet-weather wastewater overflows from EOP 211 at 520 Blockhouse Bay Road.
- EIWQIP – Newmarket Stream: Huntly, Parkfield and Claremont Separation Project
- Concept design for the Huntly, Parkfield and Claremont Separation Project was completed during FY26. The proposed project includes approximately 900 m of new public stormwater network and private drainage separation for approximately 80 properties. The project is expected to reduce wet-weather wastewater overflows to Newmarket Stream from EOPs 428 and 733, while also reducing stormwater inflows to the wastewater network.
- EIWQIP – Newmarket Stream: Kingdon St & Lower Khyber Pass Separation Project
- The construction of the Kingdon St & Lower Khyber Pass Separation Project is nearing completion. The proposed project includes approximately 600 m of new public stormwater. The project is expected to reduce wet-weather wastewater overflows to Newmarket Stream from EOPs 427 and 733.
- Currently in construction

5.3 Remediation

All urgent identified public network faults affecting service are passed on to Watercare's Service Delivery teams to be fixed. Other public faults are included in Watercare's renewals programme for prioritisation and repair.

Auckland Council's Compliance team (on behalf of Watercare) issues 'Compliance Letters' and 'Notices to Fix' defective private drainage as identified through the programmes and follows-up with property owners. Generally, property owners fix their issues in the permitted time. Depending on the severity of the issue and impact, Auckland Council can issue fines for significant delayed repairs.

In some cases, defective private drainage that property owners do not address go on the property's Land Information Memorandum (LIM). Consequently, owners often address these drainage issues when intending to sell their house.

5.4 Completed Investigations

Table 5-1 summarises the number of properties, along with the number of private and public issues identified within each investigation area completed during this reporting period. Due to the reactive nature of some of the I&I investigation works, some of the catchment investigations planned for this financial year were either not started or their completion was delayed to next financial year.

5.5 Future Investigations

Table 5-2 summarises the investigations projects / areas planned for next financial year.

6 NETWORK IMPROVEMENTS

6.1 Introduction

The summary tables in this section comprise of improvement works projects that are either completed, in progress, or planned, that come from Watercare's Improvement Works Programme. This programme tracks significant network improvement projects across Auckland, and so the projects summarised in Section 6.3, Section 0, and Section 6.5 include major works only. Project dates listed in this Section depend on current work plans and all dates are subject to change.

6.1.1 Wastewater Network Strategy

Condition 13 of the NDC requires Watercare to prepare, review and update its Wastewater Network Strategy (WWNS) every six years, and implement the Wastewater Network Improvement Works Programme as set out in the WWNS. Conditions 15, 16, 17, 18, 20, 21 and 22 of the consents outline the requirements of the WWNS. These sections describe network improvement planning and prioritisation of network improvements for a period of six years. Watercare completed the first WWNS in 2017 and the second was completed in June 2023 and submitted to Auckland Council for review. The next iteration of the WWNS will be started in 2027 with submission in 2029.

6.1.2 Informing catchment analyses and improvements

Condition 9 requires the existing network to achieve an average of no more than two WWO events per EOP per year. If this is not Achieved, an alternative discharge frequency using Best Practicable Option methodology for that EOP must be determined.

System performance analysis is completed during modelling of both the transmission and local networks. This analysis provides a baseline and expected future performance of the network and EOPs. Watercare's modellers can then compare developments and changes to flows within a network to identify any changes to EOP performance.

The frequency and volume of WWO per EOP and overall level of service within a catchment helps to determine the prioritisation of improvements, future projects, and catchment analysis. For each wastewater catchment, multiple criteria are assessed, including, but not limited to:

- EOP overflow volumes and frequencies
- Type 3 overflows (uncontrolled)
- Growth
- Level of service
- Operational issues

Watercare's planners and engineers rank these criteria to support prioritisation of catchment studies, options analysis and current and future improvement works and project interdependencies within the Asset Management Plan and subsequently the WWNS.

In addition, the network performance is assessed against expected wet weather responses to identify where excessive rain related inflows are occurring. Departures from expected performance feed into inflow and infiltration programmes.

Over the 25-26 reporting period, Watercare has installed around 5,000 smart level sensors throughout the network, which will provide considerable evidence confirming network performance

and supporting catchment prioritisation. These sensors will identify normal expected responses within a catchment and will detect variances to this due to blockage or failures in the network, or excessive rainfall response.

6.2 Central Interceptor Programme

Projects that are specific to the Central Interceptor programme have not been included in this section as there are a high number of these projects and the nature of this programme is complex and extensive.

Information regarding site-specific Central Interceptor works can be found on the Watercare website (https://www.watercare.co.nz/Central-interceptor).

As of May 2026, the Central Interceptor project is complete with the commissioning of the northern section following the commissioning of the southern section in March 2025. Benefits in network performance associated with commissioning the northern section will be seen in the 2026/2027 annual report. Network improvements in the Western Isthmus now shift to the delivery of the remainder of the programme (now called the Waitematā Water Quality Improvement Programme), which further extends the benefits delivered by the Central Interceptor. The individual projects that make up this programme are described through subsequent sections of this report.

6.3 Works completed between 1 July 2025 and 30 June 2026

Table 6-1 lists wastewater network improvement projects completed during the reporting year. These projects include upgrades and renewals.

Table 6-1: Wastewater network improvement projects completed in 2025-2026

Project Name	Reason for Project	Anticipated Outcome	NDC Catchment
Pohutukawa Pipeline Duplication	Significant air management issues associated with interactions between gravity sewers, rising main discharges and the downstream siphon.	Improve network reliability and hydraulic performance through rehabilitation of the existing pipeline and separation of pressure and gravity flows.	Orewa (Hibiscus Coast)
Warkworth Street Pump Station (DPWWS)	Provide infrastructure to transfer wastewater from Warkworth to Snells Beach WWTP, address existing overflows, accommodate growth and support the relocation of treated discharges from the Mahurangi Harbour to the ocean.	Increase wastewater conveyance capacity to accommodate growth and reduce overflows at EOPs 790, 1540 and 1258.	Mahurangi
Central Interceptor – Stage 2 (Northern Section)	Increase wastewater conveyance capacity through commissioning of the northern section of the Central Interceptor, including flow diversions at the Rawalpindi and Tawariki drop shafts.	Capture and convey flows from major EOPs at Lyon Avenue and Haverstock Street, reducing wastewater overflows and relieving capacity constraints on the Ōrākei Main Sewer and Eastern Interceptor.	Waitematā
Redhills Pipeline B	Provide wastewater servicing infrastructure to accommodate planned growth in the Redhills area.	Enable decommissioning of the existing wastewater tankering arrangement and provide permanent wastewater servicing capacity for future development.	Henderson Creek
Lake Road Northcote PS and rising main upgrade	Rising main has a history of failure, WWOs in existing and future scenarios, approx. 4 hours storage creating high risk of spill.	Reduced risk of DWOs as a result of asset failure. Reduces overflow volume/ frequency at EOPs 830, 863 and Type 3 location S26 and allows for growth	Shoal Bay
Clonburn Pipe Replacement	Replace a high-risk wastewater pipeline in very poor condition.	Improve network reliability, resilience and maintainability by replacing the existing pipeline with a more accessible asset located within the road corridor.	Hobson Bay
Māngere Pump Station PS86 (DPCIN)	Improve wastewater conveyance capacity and provide connectivity to the Central Interceptor to accommodate flows from the Māngere catchment.	Increase network capacity and reduce the frequency and risk of wastewater overflows within the catchment.	Māngere

Jonathan Place Pipe Upgrades	Address recurring wastewater overflows and customer complaints, with approximately six overflows reported annually.	Improve wastewater conveyance capacity and reliability, reduce recurring overflows and support achievement of network level-of-service targets.	East Coast Bays
Warkworth Heritage Bridge Over-pumping	Address hydraulic constraints contributing to upstream surcharging and overflows at EOP 1540 on Elizabeth Street, Warkworth.	Reduce the frequency and risk of overflows at EOP 1540 through installation of an over-pumping system that bypasses the constrained pipeline section and transfers flows downstream.	Mahurangi Harbour

6.4 Works in progress between 1 July 2025 and 30 June 2026

Table 6-2 provides a summary of all wastewater network improvement projects that took place, but were not completed, during the reporting year. There are many multi-year projects that continue to progress across the entire Auckland region.

Project classifications are based on the reported programme stage and anticipated delivery timeframe. Actual progress during the 2025/26 reporting period, including completion and commissioning milestones, remains subject to confirmation by Watercare's Planning and Projects teams.

6.5 Works planned to begin between 1 July 2025 and June 2026

provides a summary of wastewater network improvement projects Watercare has planned, as of June 2026, to begin in the 2026-2027 period, subject to approval of business cases. These projects are mainly in response to anticipated population growth and to reduce high frequency and volume of overflows in poorly performing areas. Engineered overflow points proposed for installation can be found in 0.

Table 6-2: All projects associated with wastewater network upgrade and improvements that were underway during the reporting year 2025-2026

Project name	Stage	Project purpose	Proposed works	Timeframe	Catchment(s)
Warkworth Growth Servicing	Design	Support growth in northern Warkworth and reduce overflows at existing EOPs.	New pipeline connecting northern Warkworth to Warkworth Street Pump Station.	2020–2028	Warkworth
Waiwera Wastewater Servicing	Execution	Enable decommissioning of Waiwera WWTP and eliminate associated treated wastewater discharges.	New pump station and pipeline connecting Waiwera to the Army Bay WWTP network via Hatfields Beach.	2021–2026	Waiwera, Orewa
Silverdale West Wastewater Pump Station and Rising Main	Feasibility	Provide wastewater capacity for planned growth in Silverdale West and Dairy Flat.	New pump station and pipeline connecting to the Milldale Branch Sewer.	2037+	Weiti, Orewa
Hobbs Bay Pumping Station Contingency	Design	Improve operational resilience and reduce flood-related risks.	Site regrading, flood-resilient pump station building and additional storage.	2022–2027	Whangaparāoa
Stanmore Pump Station and Rising Main Upgrade	Feasibility	Support growth, reduce overflows and address ageing infrastructure and corrosion risks.	New pump station and rising mains connecting Stanmore Bay to Army Bay WWTP.	2023–2033	Whangaparāoa
Gulf Harbour Wastewater Servicing	Feasibility	Support growth and reduce overflows to Gulf Harbour Marina by addressing existing network constraints.	New pump station and rising main.	2037+	Whangaparāoa
Wairau Valley Diversion	Feasibility	Support growth, reduce overflows, improve flood resilience and enable other North Shore upgrades.	New pump station at Wairau Road, with rising and gravity mains to Rosedale WWTP.	2035+	East Coast Bays
Mairangi Bay Gravity Sewer Upgrade	Design	Increase capacity for population growth and reduce controlled and uncontrolled overflows.	New gravity main upstream of Sidmouth Street Pump Station.	2023–2028	East Coast Bays
Torbay Wastewater Network Upgrades	Feasibility	Support growth and reduce controlled and uncontrolled overflows.	Eleven network capacity upgrades involving sewers, pump stations and wet-weather storage.	2034+	East Coast Bays, Long Bay
Forrest Hill Wastewater Catchment Diversion	Design	Support forecast growth and reduce overflows to nearby beaches and swimming areas.	New gravity main upstream of Alma Road Pump Station and increased pump station storage.	2035+	East Coast Bays, Takapuna
Northcote–Chatswood Wastewater Network Upgrades	Design	Support population growth and reduce controlled and uncontrolled overflows.	New pump station, rising main and gravity main diverting flows to the Birkdale Branch Sewer.	2018–2028	Shoal Bay, East Coast Bays
Unsworth Heights Diversion	Feasibility	Address recurring blockages associated with a dipped pipeline section and reduce uncontrolled overflow risk.	Increase local network capacity.	2037+	Upper Harbour North
Kahika Pump Station Upgrades and Rising Main Extension	Feasibility	Support growth, reduce overflows and enable the Beach Haven Diversion.	Upgrade Kahika Pump Station and extend the rising main to the Wairau Branch Sewer.	2035+	Upper Harbour South

Project name	Stage	Project purpose	Proposed works	Timeframe	Catchment(s)
Whenuapai and Redhills Wastewater Servicing (including Northern Interceptor Stage 2)	Execution	Provide wastewater services for planned growth and enable future overflow-reduction projects.	New pump station, collector sewer and tunnel to Hobsonville Pump Station, including Northern Interceptor Stage 2.	2018–2029	Upper Harbour West
Northern Redhills Wastewater Pipeline and Brigham Creek Pump Station	Feasibility	Support growth by diverting flows and providing additional pumping capacity.	New gravity pipeline connecting Redhills to the future Brigham Creek Pump Station.	2037+	Upper Harbour West
Northern Interceptor – Stage 1	Execution	Support northwest growth, reduce overflows to Henderson Creek and divert flows from Māngere WWTP.	Hobsonville Pump Station upgrades, new rising main to Rosedale WWTP and treatment plant integration.	2021–2026	Upper Harbour West, Kumeū/Huapai, Henderson Creek, Whau River
Northern Interceptor – Stages 3, 4 and 5	Feasibility	Support future growth, reduce northwest overflows and further divert flows from Māngere WWTP.	Additional pumping capacity, duplication of the Hobsonville–Rosedale pipeline and extension towards Henderson and Te Atatū.	2023–2036	Upper Harbour West, Henderson Creek, Whau River
WIWQIP – Westmere Wastewater Catchment Improvements	Feasibility	Support growth and reduce overflows from 14 EOPs discharging towards Motions Creek.	Increase conveyance capacity between Westmere and the Ōrākei Main Sewer.	2037+	Cox's Bay
WIWQIP – Grey Lynn Park Stage 1 and Branch 6 Collector	Design	Support growth and reduce overflows to Motions Creek.	Collect and convey overflow flows to the Central Interceptor at Tawariki Street.	2037+	Cox's Bay
WIWQIP – Herne Bay Branch 5 Upgrade	Execution	Support growth and reduce overflows affecting Safeswim-monitored beaches in Herne Bay and St Marys Bay.	Collect and convey overflow flows to the Central Interceptor at Point Erin.	2022–2028	Cox's Bay, Western Isthmus
WIWQIP – Point Chevalier Catchment Improvements (CC1)	Feasibility	Support growth and reduce overflows to Meola Creek and eastern Point Chevalier.	Convey flows to Central Interceptor Link Sewer B at Rawalpindi Reserve.	2037+	Western Isthmus, Cox's Bay
WIWQIP – Avondale–Whau CC6 Stage 1 to PS25 Shaft	Feasibility	Support growth, reduce overflows to the Whau River and enable CC6 Stage 2.	Convey flows to Central Interceptor Link Sewer C at Miranda Reserve.	2022–2030	Western Isthmus, Cox's Bay
WIWQIP – Waterview CC6 Stage 2	Feasibility	Support growth, enable Fairlands Tunnel decommissioning and divert flows from the Ōrākei Main Sewer.	Connect to Central Interceptor Link Sewer C via CC6 Stage 1.	2037+	Western Isthmus, Cox's Bay
WIWQIP – Avondale–Whau CC7A and CC7A1	Feasibility	Support population growth and reduce overflows.	Convey flows to Central Interceptor Link Sewer C at Miranda Reserve.	2024–2029	Western Isthmus, Cox's Bay

Project name	Stage	Project purpose	Proposed works	Timeframe	Catchment(s)
WIWQIP – Avondale–Lynfield Branch to Haycock Shaft	Feasibility	Support population growth and reduce overflows.	Convey flows to Central Interceptor Link Sewer C at Haycock Avenue.	2037+	Western Isthmus, Cox's Bay
Queen Street Diversion	Execution	Support CBD growth, reduce overflows and address risks associated with ageing infrastructure.	New pipeline from Mayoral Drive to the Ōrākei Main Sewer at Victoria Street.	2020–2027	Central Auckland (CBD)
Newmarket Gully	Feasibility	Support growth and reduce overflows to Hobson Bay and contributing streams.	New storage tunnel collecting overflows from Branch 3 and Newmarket Gully and conveying flows to the Ōrākei Main Sewer.	2023–2033	Hobson Bay
Archboyd Avenue Pump Station and Associated Pipelines	Execution	Reduce overflows and accommodate growth, including planned Kāinga Ora developments.	New pump station and associated pipelines.	2021–2028	Māngere
Dunkirk Stage 2 Rising Main	Execution	Increase wastewater capacity to support growth.	New rising main connecting Dunkirk Pump Station to the Eastern Interceptor.	2021–2028	Lower Tāmaki River
PS14 Upgrade – Tāmaki	Feasibility	Address capacity constraints, potential uncontrolled overflows and sea-level-rise risks.	Increase pumping capacity and improve resilience to coastal inundation.	2037+	Lower Tāmaki River
Ōtara Catchment Wastewater Capacity Upgrades	Execution	Support growth, reduce overflows and enable upstream network improvements.	New pump station and rising main, increasing storage and pumping capacity to PS31 Ōtara.	2015–2028	Upper Tāmaki River
Ōtara Local Network Upgrade	Feasibility	Support population growth and reduce overflows.	Gravity sewer upgrades connecting to the new Hannah Road Pump Station.	2035+	Upper Tāmaki River
Howick Wastewater Catchment System Upgrades	Feasibility	Support growth and reduce overflows.	Divert flows from the Howick Interceptor and Bucklands Beach Branch Sewer towards the Tāmaki Interceptor.	2037+	Upper Tāmaki River
Southern Auckland Wastewater Servicing Scheme	Design	Provide wastewater capacity for planned growth in Drury, Hingaia and Ōpaheke.	Upgrade Hingaia Pump Station and construct a rising main to the Southwestern Interceptor.	2018–2030	Pahurehure Inlet
Pukekohe Trunk Sewer – Isabella Pump Station	Execution	Support planned growth in Pukekohe North and Paerata.	New pump station and trunk sewer, enabling decommissioning of Cape Hill and Isabella pump stations.	2021–2028	Pukekohe
Jutland Pump Station Diversion	Execution	Remove downstream capacity constraints and enable full use of Jutland Pump Station capacity.	New gravity main.	2022–2027	Pukekohe
Paerata Wastewater Servicing	Design	Provide wastewater capacity for planned growth in Paerata.	New pump station and rising main connecting Paerata to Pukekohe North.	2033+	Pukekohe
Unitec Wastewater Diversion	Execution	Support growth at the Carrington Road site and reduce overflows to Oakley Creek.	New pipeline diverting flows from the capacity-constrained Oakley Creek pipe bridge to the Ōrākei Main Sewer.	2022–2026	Western Isthmus
WIWQIP – Motions Catchment Improvement Works	Feasibility	Support growth and reduce overflows to Motions Creek.	New tunnel collecting overflow flows and conveying them to the Central Interceptor at Western Springs Park.	2023–2033	Western Isthmus

Project name	Stage	Project purpose	Proposed works	Timeframe	Catchment(s)
Wairau Valley Branch Trunk Sewer Renewal	Design	Renew critical infrastructure in poor condition and reduce the risk of asset failure.	Condition-based relining of sections of the Wairau Branch Sewer.	2023–2028	East Coast Bays
Linwood Avenue Pipe Upgrades	Feasibility	Reduce wastewater overflows.	New gravity main.	2037+	East Coast Bays
Castledine Catchment Diversion to Eastern Interceptor	Design	Support growth in Glen Innes and Tāmaki and reduce overflows to the Lower Tāmaki River.	New gravity main diverting flows to the Eastern Interceptor.	2024–2028	Lower Tāmaki River
Beach Haven Diversion	Feasibility	Support growth and reduce overflows to the Waitematā Harbour.	New pipeline increasing conveyance capacity to Kahika Pump Station.	2034+	Upper Harbour South
Mission Bay/St Heliers Network Servicing Plan	Feasibility	Identify and prioritise projects to maintain service levels and accommodate growth.	Develop and prioritise future network improvement works.	2026–2027	Waitematā
Whau/Lynfield Network Servicing Plan	Feasibility	Identify and prioritise projects to maintain service levels and accommodate growth.	Develop and prioritise future network improvement works.	2026–2027	Manukau Harbour
Clonburn Road Wastewater Diversion	Execution	Improve network reliability and resilience while reducing future maintenance requirements.	New gravity main diverting flows from the existing network to enable rehabilitation.	2023–2027	Hobson Bay

Table 6-3: Planned wastewater network upgrade and improvement projects beginning in 2026-2027 reporting year

Project Name	Reason for Project	Anticipated Outcome	Estimated Timeframe	Catchments
WIWQIP Freemans Bay Wastewater Upgrade	Reduce the frequency and volume of wet-weather wastewater overflows, improve water quality and accommodate growth in Freemans Bay.	Reduced frequency and volume of wet-weather wastewater overflows from the combined sewer network (EOP 183).	2026–2029	Western Isthmus / Cox's Bay
WIWQIP Oakley Wastewater Catchment Improvement Works	Upgrade the wastewater network to reduce wet-weather overflows, improve water quality and accommodate growth. The project is currently in the scoping phase.	Reduced frequency and volume of wet-weather wastewater overflows.	2025–2029	Western Isthmus (Central Interceptor) / Cox's Bay
Ōrākei Main Sewer Renewal	The Ōrākei Main Sewer is approaching the end of its useful life and requires rehabilitation or replacement to maintain network resilience.	Complete scoping of rehabilitation and replacement works to address immediate asset condition and criticality risks, while ensuring sufficient capacity for future flows.	2026–2036	Waitematā
Eastern Interceptor Capacity Assessment	Assess the future need to duplicate the existing Eastern Interceptor to improve levels of service and accommodate growth.	Identify capacity requirements associated with growth and levels of service, including any loss of capacity resulting from relining.	2026 onwards	Waitematā / Tāmaki
Manukau North Network Servicing Plan	Identify network improvements required to maintain levels of service and accommodate future growth.	Identify and prioritise future network improvement projects.	2026–2027	Lower Tāmaki River
Kahika Network Servicing Plan	Identify network improvements required to maintain levels of service and accommodate future growth.	Identify and prioritise future network improvement projects.	2026–2027	Upper Waitematā
Orewa Pump Station – Pump Upgrades	Confirm upgrade requirements to maximise pumping capacity and accommodate growth ahead of upgrades required to service the ultimate population.	Maintain levels of service and provide capacity to accommodate growth.	2026–2032	—
Māngere Transmission Masterplan	Assess committed works and growth projections to identify additional infrastructure requirements or changes to project priorities needed to maintain levels of service.	Identify infrastructure requirements and priorities to accommodate growth and maintain levels of service.	2026–2028	—
Rosedale Transmission Masterplan	Assess committed works and growth projections to identify additional infrastructure requirements or changes to project priorities needed to maintain levels of service.	Identify infrastructure requirements and priorities to accommodate growth and maintain levels of service.	2026–2028	—
Eastern Interceptor Renewal	Scope renewal works for the Eastern Interceptor to improve network resilience and assess potential changes in performance associated with relining.	Improve network resilience and extend the operational life of the asset.	2026–2036	—

7 NEW ASSETS

7.1 Introduction

Continued development and population growth in Auckland require Watercare to make additions to both the local and transmission wastewater networks. This allows Watercare to service areas of urban intensification and greenfield growth.

7.2 New pump stations installed in 2025-2026

There have been two complex assets commissioned during the reporting period, with details presented in Table 7-1.

Table 7-1: Pump stations installed during 2025-26 reporting period

Facility Code and Name	Catchment	Date Installed	Reason for New Asset
DPSC7 Scott Point 7 Wastewater Pump Station	Upper Harbour West	July 2025	To service the new residential development at Scott Point precinct.
DPSPD Spedding Road Pump Station	Upper Harbour West	June 2026	Temporary pump station servicing new development.

7.3 Other network assets

New WW network pipes added to cater to the growth in the region include -

- Following completion of the Northern Interceptor Stage 1, which will diverted flows from the Northern Strategic Growth Area (NorSGA) and South Rodney to the Rosedale wastewater treatment plant, works continue to integrate this line to the Rosedale WWTP and is expected to be completed by end of 2026.
- The Redhills gravity pipelines package linking new housing development to the trunk network was completed in June 2026, to cater for growth in this area.
- The Archboyd Wastewater upgrades will include a 400 m pipeline connection directly into the Eastern Interceptor beneath Māngere East. This project is underway, with the much of the pipeline in place.
- The Central Interceptor project was completed in May 2026, and further information about this major programme can be found on the Watercare website (https://www.watercare.co.nz/Central-interceptor).

8 PUBLIC INFORMATION

8.1 Publicly available information

Condition 65 of the NDC requires Watercare to make information about the NDC available to the general public. Specifically, Watercare needs to provide:

- General information on the wastewater network and material about undertaking works in the vicinity of wastewater pipes, to help prevent accidental damage that could result in wastewater discharges
- Information about wastewater and stormwater drainage, and the need and reasons for ensuring that service connections on properties drain into the appropriate system, including advice for property owners on how this can be achieved
- General information for private property owners who believe they may have cross-connections about how they can test for this and rectify it
- Information about the general function and operation of the wastewater network, including information about the nature of wet weather wastewater overflows and information directed at raising awareness about the potential effects on the receiving environment
- Information about the location of Engineered Overflow Points that are known to discharge at high volume more than 12 times per year, and the risk of contact recreation at these locations following periods of heavy rain

Watercare hosts a range of pages that include information about the wastewater on its website (www.watercare.co.nz). The following sub-section details the range of information available to the public.

8.1.1 Undertaking works

Watercare presents material about undertaking works in the vicinity of wastewater pipes, to help prevent accidental damage that could result in wastewater discharge:

https://www.watercare.co.nz/builders-and-developers/about-works-over/working-near-or-over-our-assets

8.1.2 Wastewater and stormwater drainage

For information on how the wastewater system is designed, and how overflows occur, and what can be done to prevent outflows we include the following relevant links:

https://www.watercare.co.nz/home/faults-and-outages/how-we-manage-wastewater-overflows ; https://www.watercare.co.nz/residents/learn/what-not-to-flush

Watercare responsibilities for the wastewater network:
https://www.watercare.co.nz/residents/help-and-support/who-is-responsible

Stormwater and wastewater lessons for schools:

https://www.watercare.co.nz/residents/learn/free-water-education-lessons

Disposal of fats, oils, and grease: https://www.watercare.co.nz/residents/learn/what-not-to-flush

8.1.3 Cross-connections

Information about wastewater and stormwater drainage, and the need and reasons for ensuring that service connections on properties drain into the appropriate system, including advice for property owners on how this can be achieved: https://www.watercare.co.nz/home/faults-and-outages/how-to-prevent-blockages-and-overflows

8.1.4 General function

For general information about the wastewater network:

https://www.watercare.co.nz/home/about-us/what-we-do/wastewater

https://www.watercare.co.nz/home/faults-and-outages/how-we-manage-wastewater-overflows

In addition to the above, Watercare operates a 24/7 customer call centre. Customer requests for information are logged and responded to accordingly (Figure 8-1):

https://www.watercare.co.nz/home/faults-and-outages

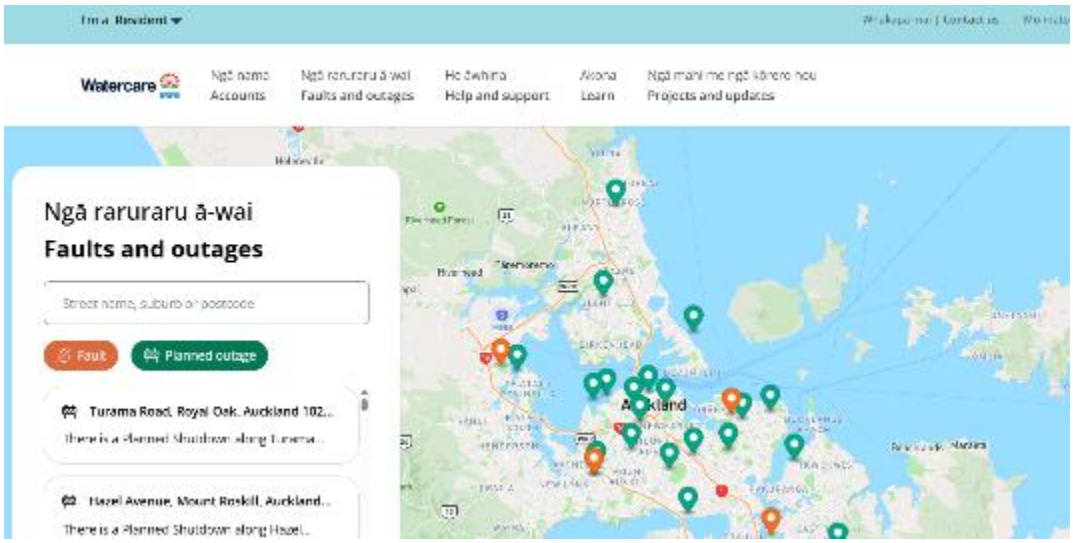

Figure 8-1: Fault and outages used to inform communities

8.1.5 Engineered Overflow Points

Information on wastewater overflow points and performance goals for WWOs, sustainability measures, and projects that reduce overflows:

https://www.watercare.co.nz/home/faults-and-outages/how-we-manage-wastewater-overflows;

https://www.watercare.co.nz/residents/help-and-support/wastewater-faqs

The Safeswim website provides information on the safety of swimming at Auckland's beaches (https://safeswim.org.nz). The Safeswim model uses real-time data from a range of models, including Watercare's wastewater water network models, with the ability for Watercare and HW staff to make manual overrides as appropriate. This is often supported by social media posts notifying public of new black flags. A report is available upon request which contains information about specific Engineered Overflow Points integrated into the Safeswim system.

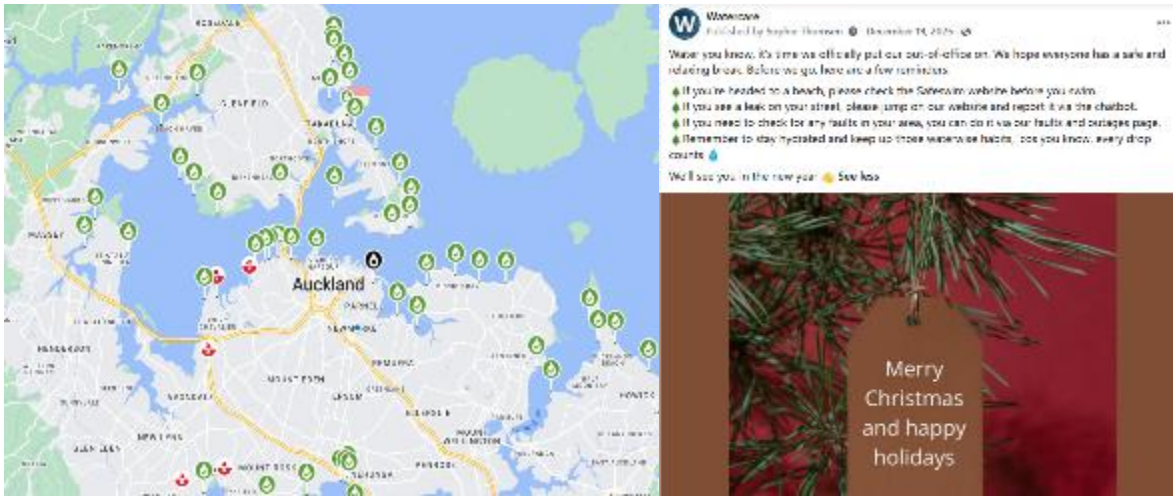

Figure 8-2: Examples of Safeswim website showing swimmable beaches, and a Facebook post associated with Safeswim

8.2 Other initiatives

Key updates since the 2024-25 report

Since the previous reporting period, several key updates have been made across Watercare's public education and engagement activities:

- Ongoing Education (see section 8.2.3): Continued release of *Tapped In* newsletters, with increased student participation in the school education programme and greater community reach through local events and libraries.
- Campaigns and social media (see section 8.2.4): New social media campaigns and posts were launched to promote correct wastewater use and system awareness, supported by platform expansion and increased engagement.
- Wonder Wai Discover Centre: A travelling interactive experience was launched to engage communities across Auckland, helping people understand the full water journey including wastewater activities: What Not to Flush, Treat to Sea, Biosolids education (see section 8.2.3)
- Maintenance Vehicle Signage (see section 8.2.5): Signage extends across maintenance vehicles, improving visibility and reinforcing messages about preventing blockages.
- Auckland's Biosolids future (see section 8.2.6): Public engagement undertaken from Nov-Dec 2025 to raise awareness of the Biosolids future servicing challenge and the wastewater journey, with findings from the engagement published in April 2026.
- Segmented e-communications: have been introduced to tailor messages relevant to various segments to help increase awareness around wastewater services and local networks; these include schools, residents and retirement villages.
- FLOW event July 2026 (see section 8.2.7)

8.2.1 Website optimisation

Further to the 'my account' self-service portal in June 2024, there has been a chatbot introduced to support customers with queries relating to their services. These were designed to provide an intuitive and enhanced customer experience. There have also been improvements to the website structure based on insights of the customer journey and engagement and feedback from various customer segments, including homeowners, tenants, and property managers. The website's segmented journey delivers relevant information tailored to whether our users are residential customers, business owners, property managements, developers or solicitors. This provides information about wastewater and appropriate management that is tailored to each of the customer segment needs. Information in Mandarin includes how to manage accounts, how to reduce overflows:

https://www.watercare.co.nz/residents/help-and-support/information-on-managing-your-account-for-mandarin-speakers

8.2.2 Local board engagement

Local boards receive regular information from Watercare on the delivery of programmes and projects aimed at improving network capacity, resilience, and environmental outcomes. Information is tailored to the interests and priorities of individual local boards and may be provided through workshops, memoranda, briefings, business meeting updates, and responses to local issues or emerging concerns. This provides local boards with visibility of both major infrastructure projects and operational activities within their area. Local boards are also proactively advised of significant wastewater events, including black flag events at beaches, and are provided with updates on response and recovery activities where appropriate.

8.2.3 Ongoing education

Watercare continues to educate the public on the causes of overflows and the actions private property owners can take to reduce the frequency and volume of overflows. Efforts include presentations at community events and distributing newsletters in specific communities to educate people about overflows. *Tapped In* is now released four times a year – both in print and a digital version - to distribute general information.

Tapped In Winter 2026 Articles: Central Interceptor (CI), (Figure 8-3 and Figure 8-4) shows the cover page and CI coverage from the newsletter).

Tapped In Autumn 2026 Articles: Large wastewater projects (refer Figure 8-3 for a snapshot of the newsletter).

Figure 8-3: Excerpt from the Autumn 2026 - Tapped In newsletter

Figure 8-4: Excerpts from the Winter 2026 Tapped In newsletter

In November 2025 we introduced a travelling, interactive education experience designed to improve Aucklanders' understanding of the water journey including wastewater treatment and the return of treated water to the environment. Wonder Wai mobile education unit activations include hands-on activities, digital games and augmented reality experiences to make water and wastewater systems accessible to a broad community audience. Activities include What Not To Flush which is available in both English and te reo Māori, and Treat to Sea, an augmented-reality experience. Treatment processes are discussed, and videos about biosolids shared along with printed activities including colouring in, word searches and mazes. During its first year, Wonder Wai directly engaged 31,701 people with an estimated reach of 184, 292. What Not to Flush was played at least 20,303 times and 8,894 times in te reo Māori and Treat To Sea recorded over 3,000 plays. These figures are minimums given activity through the Lite version was not captured (Figure 8-5).

Figure 8-5: Photos from Wonder Wai community education days

Our school education programme "WAI" delivered 435 classes across Tāmaki Makaurau to 11,745 students from kindergarten to year 8. A total of 46 schools, 9 libraries, and 45 suburbs were engaged through the public education and awareness programme during this reporting period. 54 sessions covered the topic of wastewater. Lesson five of the curriculum is focused on helping children learn about the impact of putting the wrong things down the drain and the journey of water to the beaches and waterways, as shown in Figure 8-6.

Figure 8-6: Overview of Lesson 5 Stormwater and wastewater

Figure 8-7).

https://www.watercare.co.nz/home/faults-and-outages/how-to-prevent-blockages-and-overflows

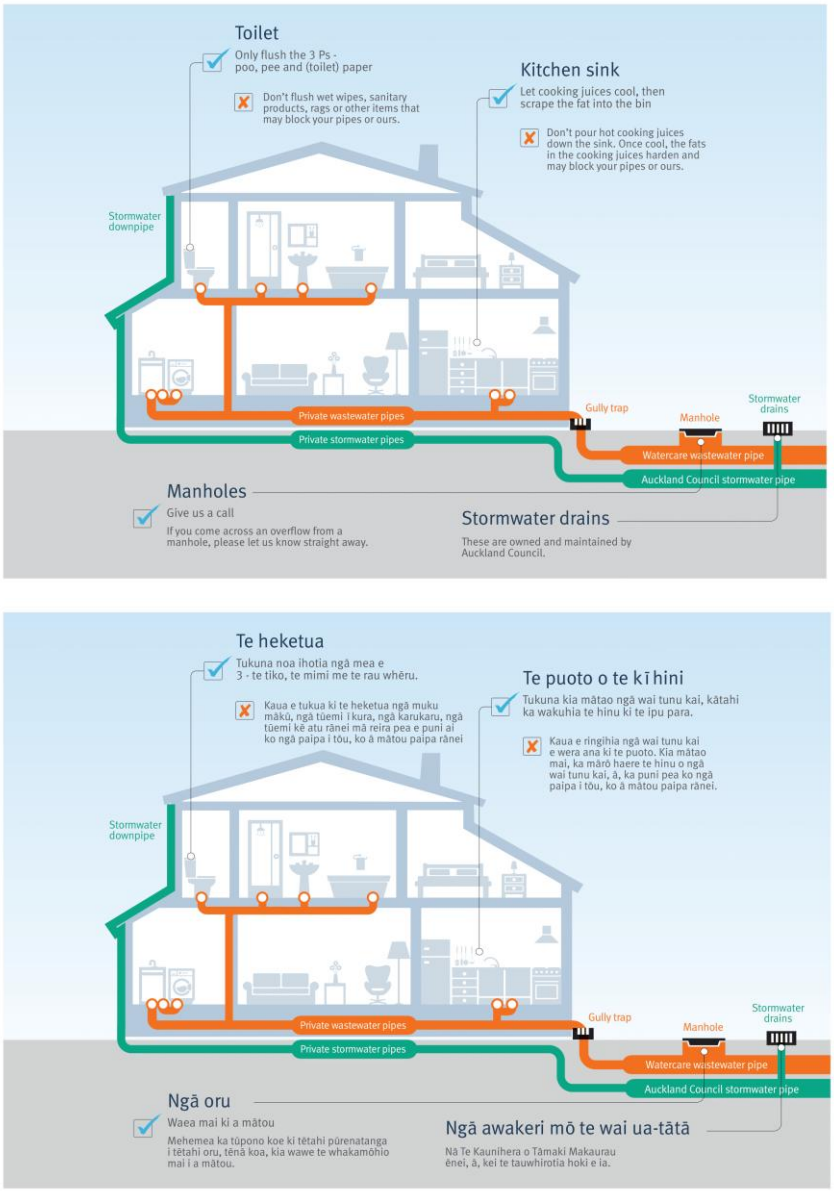

Figure 8-7: Multi-lingual (6 languages) downloadable poster of How to prevent blockages

8.2.4 Campaigns & social media

Watercare has run numerous social media campaigns to educate communities on the wastewater network. These were often targeted and in geographical locations where there were known problems occurring in the network. A few examples are shown below Figure 8-8).

TikTok wastewater educational video examples:

- https://www.tiktok.com/@watercare_nz/video/7669670676982222100
- https://www.tiktok.com/@watercare_nz/video/7673344658688281877
- https://www.tiktok.com/@watercare_nz/video/7678143527619939604
- https://www.tiktok.com/@watercare_nz/video/7574245382482398482

TikTok wastewater pumps and pipes educational video examples:

- https://www.tiktok.com/@watercare_nz/video/7639166692685450514
- https://www.tiktok.com/@watercare_nz/video/7508591543079537928

Facebook and Instagram examples:

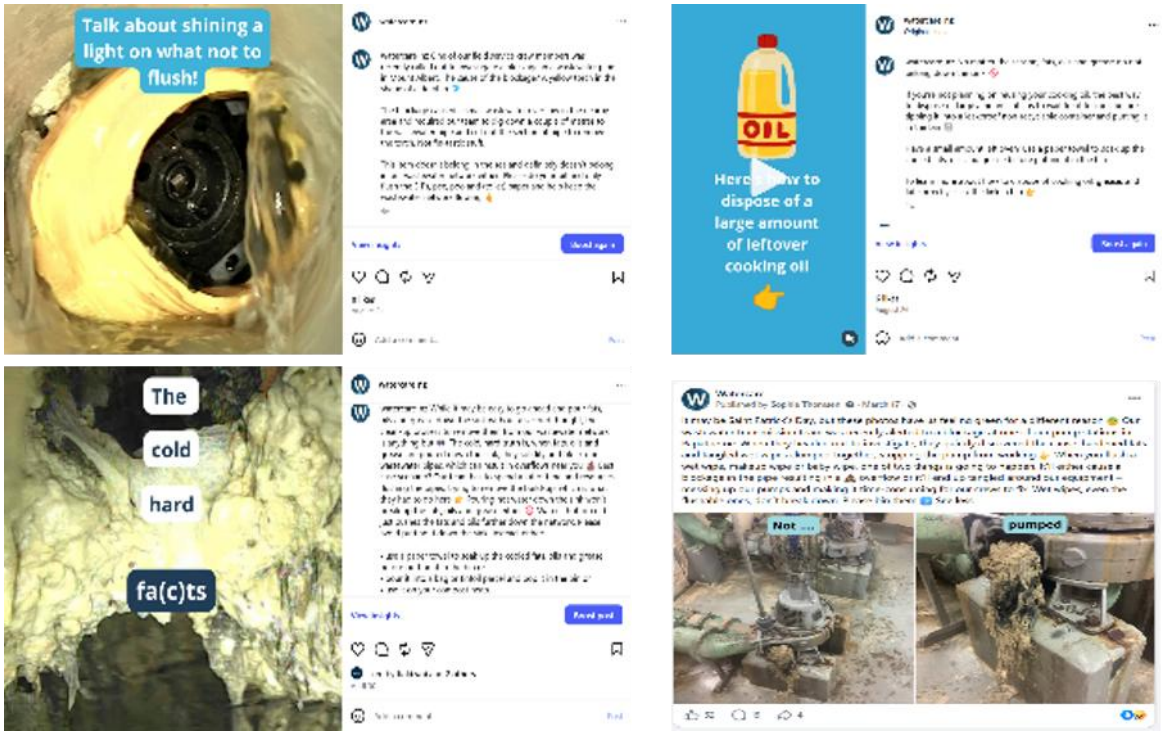

Figure 8-8: Social media posts used to educate communities

8.2.5 Maintenance vehicle signage

Watercare continues to update maintenance vehicles to help raise community awareness of the wastewater network. The signage is designed to be visible across Auckland as our crews work in different neighbourhoods, acting as a moving reminder of what not to flush, to ensure we reduce blockages and keep or pipes flowing.

Figure 8-9 Vehicle signage to educate communities on what not to flush

8.2.6 Auckland's biosolids future

In November 2025, Watercare undertook the first phase of engagement on Auckland's future biosolids challenge. The purpose of the programme was to build awareness and understanding of biosolids, explain why a new long-term solution will be needed beyond 2035, and gather early feedback from Aucklanders, mana whenua and stakeholders before options are developed. At the time, research indicated that most people knew very little about biosolids or the wastewater treatment process, making public education a key objective of the programme.

The month-long programme included mana whenua engagement, a deliberative workshop, two public surveys, a community event in Māngere, social and digital campaigns, and outreach through Watercare's *Tapped In* newsletter (Figure 8-9). Engagement reached approximately 440,000 households through *Tapped In*, more than 92,000 people through social media, attracted over 2,000 survey responses, and engaged more than 1,000 people through community events and activities.

The programme successfully increased awareness of biosolids and helped make a complex wastewater infrastructure challenge more accessible and relevant to the public. Through the engagement, Aucklanders learned more about the wastewater journey, the role of wastewater treatment, and the challenges associated with managing biosolids in the future, including the impact of what public flush. The feedback gathered has helped inform future planning and identified the information communities will need to participate in future discussions as options are developed and evaluated.

https://www.watercare.co.nz/home/projects-and-updates/planning-for-the-future/our-biosolids-challenge

Figure 8-9: Spring Tapped In 2025, Biosolids engagement report April 2026

8.2.7 Looking ahead to 2027

Over the coming year, Watercare will continue to build on its existing public awareness and education initiatives. These aim to improve how we engage with communities, strengthen understanding of the wastewater network, and encourage behaviours that support network performance and environmental outcomes.

Key areas of focus include:

- Developing a summary of the annual NDC report so the findings and improvements are clear and accessible to the general public, including how the network is performing and what communities can do to help.
- Continuing targeted public education campaigns on what can and cannot be flushed or poured down drains, with a focus on reducing blockages caused by wet wipes, fats, oils and grease.
- Developing additional digital content, videos and social media campaigns that explain how the wastewater network operates, what causes wastewater overflows, and how Aucklanders can help reduce them.
- Providing targeted communications to customers affected by an overflow event where the root cause is fats and wipes in the network.
- Continuing to share information through Watercare's website, customer communications, community events and stakeholder engagement to reach a broad range of audiences.
- Supporting local communities, schools and community groups with educational resources that promote responsible wastewater practices and environmental stewardship.
- Using the annual NDC report findings, customer research and community feedback to assess how effective our awareness initiatives are and to identify ways to improve public understanding and engagement.

9 TARGETED MONITORING PROGRAMME

9.1 Background and programme evolution

The Targeted Monitoring Programme (TMP) has undergone several stages of development since its inception. The original framework was developed by NIWA in 2015 and approved by Auckland Council in June 2015. A revised, more cost-effective programme was subsequently approved in November 2016. Initial monitoring focused on water quality and ecological assessments across three catchments but produced inconclusive results, partly due to limited temporal coverage and difficulties linking observed conditions to wastewater overflow events.

To strengthen the evidence base, Watercare subsequently trialled continuous water-quality monitoring and commissioned independent ecological investigations by AECOM and Tonkin & Taylor (T+T). In 2024, Watercare developed a revised TMP Pilot Plan, establishing a risk-based approach to site selection and monitoring across freshwater and marine receiving environments.

The pilot investigations undertaken during 2025, together with subsequent technical assessments completed in 2026, have informed the development of an integrated TMP. The revised programme is intended to address the requirements of NDC Conditions 58–61 by assessing whether the methodology in Attachment 5 appropriately characterises the recreational, public-health and ecological effects of wastewater overflows.

The importance of progressing the TMP was further reinforced by the Parliamentary Commissioner for the Environment's March 2026 review of wastewater overflows in the Mahurangi catchment. The Commissioner made several recommendations relevant to the TMP and Attachment 5, particularly concerning receiving-environment classifications, cumulative effects, environmental monitoring and the timely completion of the programme. These recommendations and their relevance to the TMP are summarised in Table 9-1.

Initial technical assessments indicate that Attachment 5 provides a reasonably robust and conservative framework for assessing wastewater overflow risks. Although opportunities for refinement have been identified, any changes are currently expected to be incremental rather than fundamental. The TMP will provide the evidence necessary to confirm this assessment and inform any revisions required under Condition 62.

Table 9-1: Parliamentary Commissioner for the Environment – Recommendations Relevant to the TMP and Attachment 5

Recommendation	What the Commissioner recommended	Relevance to TMP
1 – Risk assessment approach	Watercare and Council should consider whether prioritising overflows based on frequency is more appropriate than prioritising based on receiving-environment sensitivity or value.	Tests the underlying approach to assessing and prioritising environmental risk.
2 – Receiving-environment classifications	Review receiving-environment classifications, including whether the Mahurangi River and Estuary should be Class 1 rather than Class 2, given recreation and aquaculture interests.	Directly relevant to the receiving-environment values used in risk assessment.

Recommendation	What the Commissioner recommended	Relevance to TMP
3 – Environmental monitoring and reporting	Consider including assessments of observed adverse environmental effects in the NDC annual report, using available external monitoring information.	Supports integrating ecological monitoring, Council SOE data and other evidence into NDC reporting.
6 – Cumulative downstream effects	Consider whether Attachment 5 and the wider NDC framework adequately recognise cumulative effects on downstream receiving environments.	Directly relevant to validating and potentially refining Attachment 5.
7 – Timely completion of the TMP	Watercare and Auckland Council should consider how to facilitate the next stage of the TMP so that monitoring data is generated promptly and any necessary NDC updates are made as soon as practicable.	Directly supports your proposal to proceed with monitoring while Council reviews the revised TMP.

9.2 TMP progress and current status

The TMP Pilot Plan was submitted to Auckland Council as part of the 2024/25 NDC Annual Performance Report. The plan established a risk-based approach to monitoring freshwater and marine receiving environments, with the initial pilot intended to identify suitable monitoring sites, parameters and methodologies for the longer-term TMP.

Following completion of the pilot investigations, Watercare engaged AECOM and Tonkin & Taylor (T+T) to complete outstanding fieldwork, further evaluate the monitoring results and refine their respective freshwater and marine TMPs to align with the relevant NDC consent conditions.

Both consultants have since progressed their investigations and provided recommendations on monitoring parameters, site selection and assessment methodologies. The first section Appendix F provides the Freshwater TMP drafted by AECOM, while the second section provided the Marine TMP drafted by T+T. The following sections summarise the findings of the freshwater and marine investigations completed to date, including the continuous water-quality monitoring pilot, and outline the proposed next steps.

9.3 Freshwater component- small waterways

The freshwater pilot monitoring was completed during 2025, with the findings reported in the previous NDC Annual Performance Report. No additional freshwater fieldwork was undertaken during the current reporting period.

Watercare has since commissioned AECOM to implement the proposed freshwater Targeted Monitoring Programme over the next three years. The programme will build on the pilot findings, focusing on targeted ecological and water-quality monitoring to assess potential wastewater overflow effects and evaluate the effectiveness of the Attachment 5 methodology. Note that the final scope of the TMP will be predicated on the approval from Council.

9.3.1 Continuous water-quality monitoring

Watercare continued its Targeted Monitoring Programme (TMP) during 2025/26, using 12 continuous monitoring sensors at six EOPs. Paired upstream and downstream sensors recorded

temperature, dissolved oxygen, pH, conductivity and turbidity at 15-minute intervals to assess potential wastewater overflow effects on receiving environments.

Overall, water-quality conditions were generally within indicative healthy ranges for most parameters. Turbidity was frequently elevated and variable at both upstream and downstream sites, suggesting influences from the wider catchment. Although statistically significant upstream–downstream differences were identified for several parameters, these were generally small and did not indicate a consistent pattern of downstream deterioration.

The monitoring results provided no clear evidence of downstream water-quality degradation attributable to EOP overflows. However, short-duration or event-specific effects cannot be ruled out. The findings will support the freshwater component of the TMP.

9.4 Marine component- estuaries, basins and beaches

The marine pilot monitored six coastal receiving environments during 2025, assessing benthic macrofaunal communities, sediment characteristics, nutrients, metals and wastewater-associated contaminants, including fluorescent whitening agents (FWAs) and pharmaceuticals and personal care products (PPCPs).

The monitoring identified substantial variation in ecological condition and contaminant concentrations across sites. Motions Creek and Waterview generally exhibited the greatest ecological disturbance, while Curran Street and Hobson Bay showed comparatively better ecological condition. Coxs Bay occupied an intermediate position, while Judges Bay exhibited evidence of ecological degradation despite relatively limited modelled wastewater exposure.

Further statistical analysis undertaken by T+T in 2026 investigated relationships between wastewater exposure, sediment contaminants and benthic ecological condition. Wastewater-associated indicators were detected across the monitoring sites and were associated with variation in benthic communities, confirming their usefulness for identifying wastewater influence.

However, sediment grain size, organic enrichment and metal contamination were generally stronger explanatory factors for ecological condition. The analyses did not establish wastewater overflows as the primary cause of observed ecological degradation, highlighting the importance of considering multiple environmental stressors.

The investigation also identified opportunities to streamline the monitoring programme. FWAs were recommended as the principal wastewater-specific indicator, while routine PPCP monitoring was not considered necessary. Benthic macrofaunal assessments, sediment characteristics, metals and organic enrichment indicators remain important for interpreting ecological condition.

The study further recommended incorporating suitable reference sites and additional monitoring locations to strengthen the assessment of wastewater effects relative to other urban catchment pressures.

9.5 Safeswim and black pins

A retrospective analysis of Safeswim data from 245 locations was undertaken to examine changes in recreational water-quality warnings between 2023 and 2026 and provide supplementary evidence for evaluating the recreational and public-health components of Attachment 5.

The average proportion of time with black-pin warnings attributed to wastewater overflows decreased from 3.49% in 2023 to 1.02% in 2025, before increasing to 2.32% in 2026. Between 2023 and 2026, 85 locations improved, 24 deteriorated and 136 remained unchanged.

The most notable improvements included Point England (43.87% to 4.60%), St Marys Bay (31.57% to 1.10%) and Soldiers Bay (21.95% to 0%). Herne Bay also improved substantially (53.37% to 28.95%), although warning prevalence remained relatively high. Conversely, Judges Bay showed a marked deterioration (18.12% to 99.82%), as did Ōrākei Basin (0% to 20.74%)..

Overall swimmability declined from 84.32% in 2023 to 79.91% in 2026. However, changes in rainfall, warning methodologies and other environmental influences limit the extent to which these trends can be attributed to wastewater network performance. Comparability of the annual reporting periods, particularly 2026, also requires confirmation.

The analysis has been included in this year's NDC Annual Performance Report on a trial basis to assess its usefulness as a supplementary indicator of recreational impacts associated with wastewater overflows. Its value in supporting the TMP and evaluating the Attachment 5 risk assessment methodology will be considered before determining whether it should form part of future reporting.

9.6 Next steps

Watercare has consolidated the findings and recommendations from the freshwater and marine investigations into a revised, integrated TMP. The plan will be submitted to Auckland Council for review and approval in accordance with Condition 59.

Consistent with the Parliamentary Commissioner for the Environment's recommendation to progress the TMP without further delay, Watercare will commence the proposed freshwater and marine monitoring programmes while Auckland Council reviews the revised TMP, incorporating any changes required through that process., Watercare will proceed with the proposed freshwater and marine monitoring programmes while Council undertakes its review. The programmes will be adjusted as necessary to address Council's feedback and ensure alignment with the consent requirements.

The monitoring results will be used to confirm the effectiveness of the Attachment 5 methodology and inform any necessary refinements under Condition 62. Progress will continue to be reported through the annual NDC reporting process.

10 SUMMARY AND CONCLUSIONS

10.1 Network performance

The 2025-2026 reporting period showed mixed wastewater network performance. Overall, 4,557 Type-1 and Type-3 wastewater overflows were recorded, representing a 2.8% reduction from 4,686 in 2024-2025. While dry-weather overflows (DWOs) decreased, wet-weather overflows (WWOs) increased, highlighting ongoing network capacity constraints and the influence of rainfall-related inflow and infiltration.

Total DWOs decreased from 3,637 in 2024-2025 to 3,376 in 2025-2026, a reduction of 7.2%. This was primarily driven by a reduction in Type-3 DWOs from 3,631 to 3,341 (8.0%). Type-2 DWO alarms also decreased slightly, from 574 to 559, while Type-1 DWOs increased from six to 35.

In contrast, total WWOs (Type-1 and Type-3) increased from 1,049 to 1,181, an increase of 12.6%. Increases were recorded across Type-1, Type-2 and Type-3 categories, although Type-2 alarms are excluded from the headline overflow totals.

The number of Type-3 incidents classified as Level 3 or above decreased from 63 in 2024-2025 to 27 in 2025-2026, representing a reduction of approximately 57%.

Blockages remained a significant contributor to uncontrolled overflows, particularly those associated with roots, fats, oils and grease (FOG), and other obstructions. Changes to overflow cause classifications during the 2025-2026 reporting year, including the introduction of the Blockage of Unknown Origin category, should be considered when interpreting year-on-year trends.

10.2 Priority catchments and operational risk

Wastewater overflows continued to be concentrated in a relatively small number of catchments. Upper Tāmaki River, Western Isthmus, Henderson Creek, East Coast Bays and Hobson Bay remained prominent contributors to overflow frequency.

Upper Tāmaki River recorded the highest number of uncontrolled DWOs, while Upper Tāmaki River, Henderson Creek, East Coast Bays, Western Isthmus and Whau River collectively accounted for approximately 52% of uncontrolled WWOs.

10.3 Network improvement projects and public information

During the 2025-2026 reporting year, Watercare continued progressing network improvements, renewals and growth-related infrastructure projects aimed at addressing capacity constraints, improving resilience and reducing wastewater overflows. Key programmes included the Central Interceptor, Northern Interceptor, Western Isthmus Water Quality Improvement Programme and targeted upgrades across priority catchments.

Operational initiatives included continued inflow and infiltration investigations, preventative maintenance, and the expansion of network monitoring and data analysis capabilities. These activities support earlier identification of emerging risks, more targeted maintenance and improved operational decision-making.

Chapter 8 also outlines Watercare's public information and engagement activities, including wastewater education, guidance on preventing blockages and cross-connections, and communication of overflow risks through its website, community engagement, social media and

Safeswim. These initiatives complement physical network improvements by encouraging appropriate wastewater system use, supporting public awareness of overflow risks and helping customers understand their role in preventing avoidable discharges.

10.4 Targeted Monitoring Programme

Watercare made further progress in developing its Targeted Monitoring Programme (TMP), drawing on the freshwater and marine pilot investigations and subsequent technical assessments to refine the proposed monitoring approach.

Continuous water-quality monitoring during the reporting year 2025-2026 did not identify clear evidence of persistent downstream degradation attributable to overflows from EOPs, although short-duration effects could not be ruled out. Marine investigations identified wastewater-associated contaminants but also highlighted the influence of sediment characteristics, metals and other environmental pressures on ecological condition.

The findings provide an improved evidence base for assessing wastewater overflow effects and refining the methodology used under Attachment 5 of the NDC. Watercare will progress the revised TMP in consultation with Auckland Council, with future monitoring intended to strengthen the assessment of environmental effects and inform risk-based management decisions.

10.5 Immediate priorities

Watercare's priorities for the coming reporting period will include continued delivery of targeted network improvements, reducing recurring overflows, improving the quality and consistency of overflow data, and strengthening the connection between network performance and receiving-environment outcomes.

The 2025-2026 results demonstrate that, although improvements have been achieved in some areas, wastewater overflows remain an operational and environmental management challenge. Sustained improvements will require continued investment in network capacity and resilience, effective preventative maintenance, improved monitoring and targeted interventions informed by environmental risk.

Watercare will continue to assess progress through its annual NDC reporting and the implementation of the revised TMP.

Appendix A. Definitions and Overflow Incident Assessment

Table of definitions

Auckland	The geographical area defined in section 4(1) of the Local Government (Auckland Council) Act 2009
Best Practicable Option (BPO)	In relation to a discharge of a contaminant or an emission of noise, means the best method for preventing or minimising the adverse effects on the environment having regard, among other things, to— a) the nature of the discharge or emission and the sensitivity of the receiving environment to adverse effects; and b) the financial implications, and the effects on the environment, of that option when compared with other options; and c) the current state of technical knowledge and the likelihood that the option can be successfully applied (Resource Management Act 1991)
Class 1 Recreational Receiving Environment	An area where contact recreation is known to occur (i.e. located on a known bathing beach). If the beach is a SafeSwim site this is deemed to be an indicator of a) high use; and/or b) a known shellfish gathering site; and/or c) aquaculture areas
Computer Modelling	The formal simulation of the wastewater network using a mathematical model to predict network performance from a set of parameters and conditions, using a combination of hydrologic (such as MOUSE-ROI) and hydraulic (such as MOUSE) programmes.
Consultation	Engagement in a spirit of good will and open-mindedness to ensure that the Consent Holder is fully informed of the other parties' concerns and issues when preparing and reviewing the Wastewater Network Strategy
Controlled overflow	A discharge from the network that occurs from an engineered overflow point, either during times of dry or wet weather flows
Dry Weather Flow	The flow in the wastewater network that would occur during a normal day in a dry weather period, including wastewater, trade waste and groundwater infiltration. Groundwater is defined as any natural water, including salt water, which has not become mixed with wastewater or trade waste
Dry Weather Overflow (DWO)	An overflow that occurs during dry weather flow from any part of the network, usually as a result of blockage, breakage, mechanical or power failure at pump stations or storage facilities, system failure or the lack of hydraulic capacity in the network during periods of dry weather flow
Engineered Overflow Point	A location where a discharge from an engineered overflow structure occurs

Existing Network	The separated and combined wastewater network owned and operated by Watercare Services Limited (as the Auckland water organisation) at the time the Auckland Wastewater Network Comprehensive Discharge Permit commences. For avoidance of doubt, any additional or New Engineered Overflow Points become part of the Existing Network after the engineered overflow structure has been built
Existing Urban Area	Any area within the metropolitan urban limits, and; Any area included within the urban zones (under an operative district plan) of a rural or coastal settlement; at the time the Auckland Wastewater Network Comprehensive Discharge Permit commences
Future Network	The *Network*, including Engineered Overflow Points and other Network assets, in currently un-serviced areas within any *Existing Urban Area*; or to be constructed within any *Indicative Future Urban Area* after the area has been given an urban zoning
Indicative Future Urban Area	Any area shown in the maps in Attachment 1 as Indicative Future Urban Area
Manager	The designated person authorised by the Auckland Council, or their delegate.
Metropolitan Urban Limit	The boundary between rural area and urban area delineated on the Map Series 1, Sheets 1- 20 of the Auckland Council Regional Policy Statement (July 1999) and subsequent amendments
Network	The wastewater network owned and operated by Watercare Services Limited (as the Auckland water organisation), including all assets necessary for the operation of the network, including but not limited to pipelines, pipe bridges, siphons, rising mains, overflow structures, storage facilities and pump stations The Network includes the transmission system (the larger pipes that convey wastewater collected by local network pipes to the wastewater treatment plant.) and the local system (the smaller pipes that convey wastewater from individual properties or housing or commercial developments to the transmission network)
New Engineered Overflow Point	An Engineered Overflow Point that is an addition to the Network after the Auckland Wastewater Network Comprehensive Discharge Permit commences
Normal Operation (of the Network)	Excludes events which are due to circumstances beyond the Consent Holder's control and which cannot be provided against, and are defined as follows: (a) Chokes. Network Failure, a force majeure (including vandalism and for terrorism): (b) Heavy rain which occurs at the same time maintenance or construction or re-construction of the Network and is beyond the diversion capacity.

Overflow or Wastewater Overflow	A discharge from the Network that occurs in either a controlled manner from an Engineered Overflow Point or in an uncontrolled manner from any other point in the network, either during times of Dry Weather Flow or Wet Weather Flow
Overflow Point	An existing or future physical discharge location where the discharge is from an engineered overflow structure in the wastewater network.
Repeat Dry Weather Overflow	A Dry Weather Overflow that occurs more than once at the same location within a 12 month period
Replacement Engineered Overflow Point	A like-for-like replacement (including a minor upgrade of the Engineered Overflow Structure) of the existing Engineered Overflow Point.
Reported Wastewater Overflow	An Overflow that is reported by any person to the Watercare Control Room or that has been identified as having occurred by Watercare's telemetry system.
SEA-M1	Significant Ecological Area – Marine 1, as defined in the Proposed Auckland Unitary Plan notified 30 September 2013. An area which, due to its physical form, scale or inherent values, is considered to be the most vulnerable to any adverse effects of inappropriate subdivision, use and development.
Similar Location	A location within a radius of 500 metres of the original location provided that it is within the same receiving environment.
Type 1 Overflow Points	Engineered structures associated with a WWPS
Type 2 Overflow Points	Engineered structures that provide a relief point on the network, including combined sewer overflows (CSOs)
Type 3 Overflows Points	Uncontrolled overflow points that usually discharge from a manhole as the result of surcharging during wet weather.
Uncontrolled overflow	A discharge from any point in the network, either during times of dry or wet weather flows
Wastewater	Liquid (and liquids containing solids) waste from domestic, industrial, institutional or commercial premises including (but not limited to) toilet wastes, sullage, trade wastes and gross solids.
Wastewater Network	A system of pipes, open channels and associated ancillary structures for the purpose of conveying, diverting, storing, treating or discharging wastewater.
Wastewater Network Strategy	The document that describes network improvement planning and prioritisation of network improvements for a period of six years
Wastewater Overflow or Overflow	A discharge from the network that occurs in either a controlled manner from an engineered overflow point or in an uncontrolled manner from any other point in the network, either during times of dry weather flow or wet weather flow
Wet Weather Flow	The flow within a wastewater network that is greater than the dry weather flow, and which occurs as a result of rainfall (directly or indirectly) entering the Network

Wet Weather Overflow (WWO)	A wastewater overflow during times of wet weather flow
Wet Weather Overflow Event	One or more wet weather overflows that end(s) when all overflows have ceased discharging for more than 24 hours. Where the overflow stops and then recommences within 24 hours as a result of a single continuous or intermittent rainfall event, it is considered a single wet weather overflow event

Overflow incident level assessment

Level 1 (Spill)	A Level 1 incident is capable of being managed as a matter of routine operations, resolved in a reasonable timeframe and where there is one or more of the following: • ground containment • no discharge to a water course • contamination of less than 50 m^2 of adjacent ground • no property damage • public health risk limited to one household (private property) • no affect on in-stream ecology
Level 2 (Minor Overflow)	A Level 2 incident is capable of being managed as a matter of routine operations, resolved in a reasonable timeframe and where there is one or more of the following: • a discharge to an open water course or stormwater system and where natural dilution or containment minimises the impact on the water body • there is a low ammonia reading 100m downstream (<3ppm) • potential impact on fish/wildlife • contamination of greater than 50 m^2 of adjacent ground • minimal effect on in-stream ecology • property damage less than $1000 • potential health risk limited to 2 households (private property); or • potential health risk limited to less than 10 people (sensitive public place)
Level 3 (Significant Overflow)	A Level 3 incident requires escalation due to complexity, consequential effects and involvement of Communications and other specialist support where there is one or more of the following: • short term of less than 4 hours of high volume/rate or an extended duration of less than 12 hours (from time of notification) of low volume/rate discharge to water body or sensitive land and where minimal dilution or containment is possible • there is obvious contamination of stream/water body or the stream is anoxic and or black • there is reasonably high ammonia readings (>3ppm) 100m downstream • potential impact on in-stream ecology • in-stream ecology is stressed • potential impact on shellfish gathering • potential impact on recreational bathing • property damage less than $10,000 • health risk to more than 2 households (private property) • heath risk to more than 10 people (sensitive public place) • prosecution is possible
Level 4 (Major Overflow)	A Level 4 incident requires escalation due to complexity, consequential effects and involvement of Communications and other specialist support where there is:

	• prolonged duration of greater than 4 hours of high volume/rate or greater than 12 hours (from time of notification) of low volume discharge to waterbody or sensitive land where no containment is possible • the stream is anoxic and/or black • definite impact on fish/wildlife, severely stressed or dead • definite impact on shellfish gathering • definite impact on recreational bathing • property damage greater than $10,000 • definite health risk to more than 10 households (private property) • definite health risk to more than 100 people (sensitive public place) • prosecution is likely
Level 5 (Catastrophe)	A Level 5 incident is a catastrophe or a Civil Defence State of Emergency. A Level 5 incident is coordinated by the Executive Management Team due to consequential effects, incident management complexity and multi-agency involvement and may be triggered by a Regional or National Civil Defence Emergency or a regional Water Services event of extreme nature

Appendix C. Engineered Overflow Point Schedules

Table C-1 Schedule of Engineered overflow points

Table C-2 Schedule of overflows to private property

Table C-1 Schedule of engineered overflow points in the existing wastewatwer network, current on June 2026. The highlighted rows show where changes have been made to the schedule during the 2025-26 reporting period. Blue: EOPs that have been discovered or missed the list previously, green: newly proposed, commissioned, decommissioned or sealed EOPs.

1.0 Background

Watercare Services Limited (Watercare) have engaged AECOM New Zealand Limited (AECOM) to prepare a Targeted Monitoring Plan for Freshwater habitats (TMP-F) as required by Watercare to meet the conditions 58, 59 and 61 of the Auckland wide Network Discharge Consent (NDC).

1.1 Consent conditions

Watercare operates wastewater networks throughout the Auckland Region from Wellsford in the north to Waiuku in the south. Watercare obtained an Auckland wide NDC to manage overflows to the environment due to blockages or surcharges. The NDC was granted in 2014 by Auckland Council.

Conditions 58, 59, and 61 (Table 1-1) of the NDC require that Watercare develop and undertake a targeted monitoring programme to confirm the assumptions of Attachment 5: Methodology for the Assessment of Effects of Wet Weather Wastewater Overflows (Watercare, 2016), hereafter referred to as Attachment 5. Section 1.2 below summarises the assumptions of Attachment 5.

Table 1-1 Relevant conditions of the NDC

Condition number	Condition details	Relevant section
58	*The Consent Holder shall undertake a targeted monitoring programme with the objective of confirming that the application of the Methodology for the Assessment of Effects of Wet Weather Wastewater Overflows in Attachment 5 results in an appropriate assessment of recreational, public health and ecological effects.*	-
59	*The Consent Holder shall, within 12 months of this consent being granted, provide an outline monitoring plan setting out the scope, methodology, and timing of the proposed targeted monitoring programme to the satisfaction of the Manager for approval.*	Section 2.0
61	*The scope, methodology, and timing shall include:* *a. A methodology for collecting appropriate data on wastewater overflows, their characteristics and the changes (if any) caused in identified receiving environments.*	Section 2.4
	b. A methodology for analysing the data collected to ensure that the results are capable of achieving the targeted monitoring programme's objective.	Section 2.5
	c. A description of how the monitoring design will take account of and integrate data from existing monitoring programmes undertaken by third parties (if any) to support spatial and temporal trend analysis and assessing the influence of other factors (not related to wastewater overflows).	Section 2.6
	d. The expected timeframe over which the monitoring programme will be undertaken to achieve its objective, which must be a minimum of three years duration but not exceeding five years duration.	Section 2.3

1.2 Attachment 5: Methodology for the Assessment of Effects of Wet Weather Wastewater Overflows

Attachment 5 provides a theoretical methodology on how to characterise the ecological risk associated with wastewater overflow from engineered overflow points (EOPs). In order to categorise ecological risk, the assessment considers:

D R A F T

- The receiving environment (RE),
- The ecological value of the RE categorised into Classes 1, 2, 3 ('Class 1' being the highest ecological value and 'Class 3' being the lowest),
- The frequency/volume of overflows, and
- The potential ecological effects and their magnitude as a result of overflows in that RE.

Figure 1-1 summarises the steps taken, and these are further explained in the following sections.

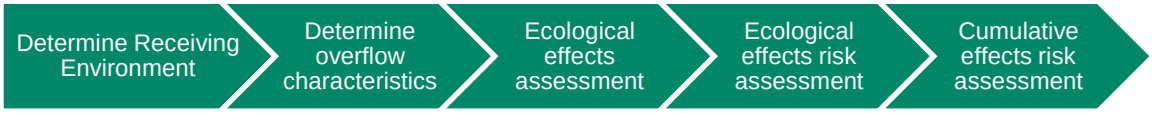

Figure 1-1 Methodology of assessing ecological risk of wastewater overflows as per Attachment 5

1.2.1 Receiving environment

Attachment 5 characterises the overflow receiving environments into seven types, comprising:

- **Small Waterways**: freshwater streams, classified as Low-Order (order 1 or 2) as per the River Environment Classification (REC) (Ministry for the Environment (MfE), 2010). Relevant to this TMP-F;
- **Large Waterways**: freshwater streams classified as Middle-Order (steams order 3 and 4) and High-Order (stream order greater than 4) as per the REC. Relevant to this TMP-F;
- **Freshwater Wetlands**: permanently and intermittently wet areas, shallow water and land/water margins that support a natural ecosystem of plants and animals that are adapted to wet conditions, as per the Resource Management Act (RMA). Relevant to this TMP-F;
- **Basins and Lakes**, which can be freshwater but are excluded from this TMP-F due to the impracticality in their monitoring; and
- **Estuaries, Beaches and Harbours** which are marine-adjacent and hence excluded from this TMP-F. They are to be addressed in a separate Targeted Monitoring Plan (Marine).

These types are further classified into three classes (Class 1, 2, and 3) depending on their ecological value (Table 1-2).

Table 1-2 Table 2.3 in Attachment 5. Classification of Ecological Value

Receiving Environment Classification	Definition	Possible sources of information
Class 1	Identified by applicable planning documents as having special protection for ecological reasons, or a Significant Conservation Area for ecology purposes. This includes stream reach types 2 (concrete channels) and 3 (highly disturbed streams) (Allibone et al., 2001) in Auckland urban areas and Wetland Management Areas.	• Coastal Plan/Unitary Plan • District Plans/Unitary Plan • Reserve Management Plans • Previous Assessment of Environmental Effects
Class 2	Non-classified areas of local ecological conservation value of a habitat type known to have some ecological value. This includes stream reach types 4 (low gradient streams) (Allibone et al., 2001) in Auckland urban areas.	
Class 3	Highly modified and disturbed coastal and freshwater areas such as stream reach types 5 (restricted fish passage streams) and 6 (steep forested streams)	

D R A F T

Receiving Environment Classification	Definition	Possible sources of information
	(Allibone et al., 2001) in Auckland urban areas. Freshwater areas could include highly modified channels and piped streams.	

1.2.2 Overflow characteristics

Overflow frequency and volume is monitored by Watercare, and grouped into three ranges – High, Medium and Low (Table 1-3 and Table 1-4). Where neither modelled nor measured data is available, Attachment 5 assumes there are no known overflows associated with the EOP and subsequently both volume and frequency is assigned Low.

Table 1-3 Table 3.1 in Attachment 5. Overflow Volume Ranges

Overflow Volume Range	Definition	Source of Information
High	Actual or estimated annual volume of 10,000 m^3 or greater.	• Modelled overflow information • Watercare telemetry (SCADA) records • Watercare operational records
Medium	Actual or estimated annual volume of between 1,000 and 10,000 m^3.	
Low	Actual or estimated annual volume of less than 1,000 m^3.	

Table 1-4 Table 3.2 in Attachment 5. Overflow Frequency Ranges

Overflow Frequency Range	Definition	Source of Information
High	More than 12 overflow events per year.	• Modelled overflow information • Watercare telemetry (SCADA) records • Watercare operational records
Medium	Between 3 to 12 overflow events per year.	
Low	2 or fewer overflow events per year.	

1.2.3 Ecological effects

Potential changes in aquatic environment and their resulting ecological effects are summarised in Table 5.1 of Attachment 5 and reproduced in Table 1-5 below. Ecological effects are scored as Very High (5), High (4), Moderate (3), Low (2) or Very Low (1) depending on the type and class of RE, and the overflow volume. This is tabulated in detail in Appendix 2 of Attachment 5, and summarised in Appendix B of this plan.

D R A F T

Table 1-5 Table 5.1 of Attachment 5. Relationship between potential physical, chemical and biological changes in aquatic environments and resulting ecological effects

Ecological Effect	Potential changes in aquatic environments associated with wastewater overflows												
	Physical change				Chemical change							Biological change	
	Elevated stream flow	Elevated water temperature	Elevated TSS concentration	Elevated organic solid concentration	Elevated nutrient concentration	Elevated toxicant concentration in water	Metal accumulation in bed sediment	Elevated BOD	Reduced DO	Elevated pharmaceuticals in bed sediment	Organic enrichment of bed sediment	Elevated pathogen concentration	Elevated stream flow
Change in physical habitat suitability	X	X	X	X	X		X	X		X		X	
Toxic concentrations of ammonia, sulphide, metals and nitrate						X	X	X			X		
Change in community structure and/or loss of sensitive species	X	X	X	X	X	X	X	X	X	X	X	X	
Behavioural changes in fin fish			X							X			
Increase in nuisance plants, including *Ulva*(sea lettuce) and diatom mats		X			X								
More frequent phytoplankton blooms in the water column		X			X								
Reduced quantities of fin fish			X			X	X	X		X	X		
Reduced quantities of shellfish			X			X	X	X		X	X		
Degradation of aquaculture and/or loss of opportunity for aquaculture			X			X	X	X		X	X		
Loss of suitability for livestock watering			X	X		X					X		X
Loss of suitability for irrigation use											X		X
Growth of sewage fungus and/or *Beggiatoa*									X				

D R A F T

1.2.4 Ecological risk assessment

Attachment 5 proposes a matrix of the overflow frequency and the ecological effects score to determine the ecological risk associated with an EOP. It considers both the likelihood of an overflow event happening (i.e. frequency) as well as the ecological consequences of the event.

Table 1-6 Table 7.1 in Attachment 5. Risk matrix for potential ecological effects

Overflow Frequency Range	Effects Score				
	5 (Very High)	4 (High)	3 (Moderate)	2 (Low)	1 (Very Low)
High	Very High	Very High	High	Moderate	Low
Medium	Very High	High	Moderate	Low	Very Low
Low	High	Moderate	Low	Very Low	Very Low

1.2.5 Cumulative effects

Attachment 5 categorises cumulative effects into temporal and spatial effects. Temporal effects are factored into the ecological effects scores so are not considered separately. Spatial cumulative effects are relevant where multiple EOPs flow into the same RE and considers the overflow frequencies and volumes.

1.3 Pilot study

A pilot study (Appendix A) was carried out by Watercare in 2025, monitoring a range of physical, physicochemical, biological and functional parameters across six sites (with Ecological Risk categorised as Moderate to Very High) once in summer (March) and once in winter (August 2025). As the purpose of the pilot study was to determine appropriate and practical parameters to monitor for this TMP-F, the study focused on ‘Small Waterways’ (as defined by Attachment 5) with higher ecological risk under the assumption that effects would be more evident, meaning parameters would be tested more efficiently.

Each site included an upstream (control) and a downstream (impact) sampling location in relation to the EOP monitored. Statistical analyses were undertaken to determine any significant differences between control and impact sites, differences between summer and winter results, and any correlations between parameters.

The pilot study recommends a range of parameters to monitor, the timing of monitoring and other considerations that form the basis for this TMP-F.

D R A F T

1.4 Purpose and scope

The purpose of this TMP-F is to confirm the application of Attachment 5 in relation to the assessment of ecological effects, and the corresponding classification of ecological risk in relation to freshwater environments (Small Waterways, Large Waterways, Wetlands). The TMP-F proposes to test the assumptions of Attachment 5 by monitoring EOPs to assess ecological effects and confirm consistency with the calculated ecological risk as per Attachment 5. The results of the monitoring should therefore assess the following assumptions of Attachment 5:

- Ecological effects are more likely in Class 1 REs than Class 3 REs;
- Ecological effects are more likely in Small Waterways than Large Waterways; and
- Ecological effects are more likely in locations with higher volumes of and/or more frequent overflows

This TMP-F sets out the requirements for:

- Selecting EOPs for ecological monitoring;
- The methodology for assessing parameters and biotic indices in relation to ecological effects;
- Monitoring and sampling timing;
- The integration of collected data with other monitoring programs; and
- Recommendations for data analyses.

This TMP-F is considered a ‘live document’ and should be updated accordingly to facilitate the appropriateness of monitoring and the application of alternative EOP sites (which can be adjusted depending on the results of the previous year’s monitoring).

D R A F T

2.0 Methodology

The methodology sets out the preferred RE for monitoring, considerations in site selection, parameters to be monitored, and the timing of monitoring.

2.1 Receiving environment

This TMP-F is exclusively focused on freshwater environments, specifically recommending monitoring for Small Waterways. Monitoring sites have been chosen predominantly for Small Waterways, with a few Large Waterways, and excluding Freshwater Wetlands. Targeting Small Waterways is recommended as comparatively;

- Small Waterways provide the least amount of dilution and spatial complexity meaning these sites are more reliable in capturing the characteristics and source of wastewater overflows.
- Small Waterways provide opportunity for selection of a control site (upstream) allowing for the isolation of EOP overflow and a benchmark for effect comparison.
- Small Waterways are more easily accessible meaning monitoring is repeatable, measurable and practicable.
- Best practice guidance for monitoring New Zealand freshwater ecology is more concentrated on wadeable streams (Small Waterways), allowing for a range of standardised, peer reviewed monitoring methodologies to be implemented.
- Freshwater wetlands are excluded from the assessment criteria as there are currently no EOPs discharging to freshwater wetlands.

As such, targeted monitoring of Small Waterways is more likely to provide a more practicable and robust ecological assessment to test the assumptions of Attachment 5.

2.2 Site selection

2.2.1 Control site

Sampling locations have been chosen where there is both an upstream (control) site and downstream (test) site of the EOP. Upstream sites provide a potential reference condition, and therefore differences between the two sites can be more reliably attributed to ecological effects associated with wastewater discharges. Considerations for choosing the control site include:

- Physical conditions between the upstream and downstream site will be similar to limit variability; with no obstructions in between (such as a pipe discharges and/or instream structures) that may impact the water quality.
- There should be no EOP discharge(s) upstream of the EOP being tested to effectively isolate effects. Except where a longitudinal study design is proposed to assess cumulative effects. For example, EOPs situated longitudinally in Oakley Creek may provide a test of cumulative effects.
- Should appropriate sites be limiting, an EOP discharge upstream that is categorised as Low or Very Low Risk may be considered as ecological effects are expected to be minor, given that the EOP to be monitored is High to Very High Risk.
- If there are discharges upstream which are not Low Risk, the site may be considered if there are other sites within the same catchment with similar stream conditions that can provide insight for a hypothetical control site. In such cases, confidence in results may be lower.

2.2.2 Potential EOPs for monitoring

Table 2-1 lists some of the potential stream and EOP sites (x17) that are suitable for sampling that have been ground-truthed to date through field surveys. This is not exhaustive of all EOPs that are suitable for sampling and should be taken as a basis for further consideration. Full details of potential sites are provided in Appendix C.

D R A F T

The pilot study monitored six EOPs (12 sites), which was limiting for statistical analysis. For the purposes of this TMP-F, monitoring twelve EOPs (24 sites) are considered to be sufficient to confirm the assumptions of Attachment 5, while being feasibly practicable for monitoring. The number of EOPs monitored can be adjusted depending on the results of the previous year's monitoring. During the site selection process, the following must be taken into consideration:

- Sites should represent a range of ecological risk categories to test the assumptions of Attachment 5 and so that results can be compared against Table 1-6.
- As above in Section 2.1, Small Waterways are preferred over Large Waterways.
- As above in Section 2.2.1, the EOP should be associated with a suitable control site.
- Minimum of three EOP's situated longitudinally within the same catchment that represent 'High to Very High' ecological risk monitored to facilitate an understanding of cumulative effects.
- It is recommended to monitor the same sites during each of the monitoring rounds over the monitoring period, to build a more reliable baseline, increase confidence in results and potentially capture temporal trends more accurately, as this monitoring plan captures a single moment in time.
- The sites monitored during the pilot study are recommended to be included so that results are more robust.

Table 2-1 Potential EOPs to sample as part of the Targeted Monitoring Plan – Freshwater

EOP ID	Receiving environment	RE Ecology Class	Calculated Ecological Risk (Watercare, 2016)
4	Small Waterway	2	Very High
281*	Small Waterway	2	Very high
413	Small Waterway	1	Very High
511	Small Waterway	2	Very High
588*	Small Waterway	1	Very high
734*	Small Waterway	1	Very high
6*	Small Waterway	2	High
835	Small Waterway	2	High
736	Large Waterway	1	High
1518	Large Waterway	1	High
1519	Large Waterway	1	High
571	Small Waterway	2	Moderate
831*	Small Waterway	2	Moderate
850*	Small Waterway	2	Moderate
1549	Small Waterway	2	Moderate
732*	Large Waterway	2	Moderate
7	Large Waterway	2	Low

*monitored during the 2025 pilot study.

2.3 Sampling timing

Statistically significant results were observed only during the summer monitoring during the pilot study, (Appendix A). Subsequently, it is recommended that annual monitoring be implemented during the summer months (December, January, February). The monitoring programme will be undertaken for a minimum of three years as per consent condition 61 of the NDC.

D R A F T

The TMP-F focuses on long-term effects arising from EOPs overflows instead of capturing immediate impacts following overflow. This is due to the practicalities in event-based stream sampling, where distinguishing between the effects of wet weather (food events) vs attributed directly to post-overflow are often inconclusive. As such, best practice guidance is recommended for sampling timing, for example sampling should not occur within two weeks of heavy rainfall (e.g. often defined as 25 mm of rainfall within 24 hours) (sensu National Environment Monitoring Standards). As sampling sites are Small Waterways, they are easily impacted by heavy rainfall, and enough time must be allowed for the biological communities (macroinvertebrates, diatoms) to recover before sampling. Although Attachment 5 focuses on wet weather discharges, monitoring regardless of overflow events is deemed to be practical and sufficient for the purposes of identifying ecological risk.

2.4 Monitoring parameters

Based on the conclusions of the pilot study (Appendix A), the following monitoring parameters should be collected at each of the EOP upstream and downstream sites.

2.4.1 Physical and physicochemical parameters

2.4.1.1 Rapid Habitat Assessment

Rapid Habitat Assessment (RHA) (Clapcott, 2015) provides a habitat quality score indicative of the stream habitat condition, and is an efficient method to characterise any habitat differences between control and test sites, and to monitor for visual ecological effects such as changes in physical habitat suitability, increase in nuisance plants and diatom mats, phytoplankton blooms, or fungus growth (Table 1-5). It scores ten different parameters from 1-10, to give a final score out of 100, which relate to a habitat quality category (Table 2-2). The RHA is also able to provide context for streams when interpreting other indicators of water quality, such as macroinvertebrates.

Table 2-2 Habitat quality scoring criteria (Clapcott et al., 2020)

RHA Result	Habitat Quality Scores
>75	Excellent
51 – 74	Good
26 – 50	Fair
0 – 25	Poor

2.4.1.2 Instream water quality

Water clarity can be measured using a water clarity tube with a secchi disk attached. A calibrated multimeter should be used to measure to following variables *in-situ* at the time of sampling:

- Temperature (°C)
- Dissolved oxygen (DO) (%)
- Dissolved oxygen (DO) (mg/L)
- Conductivity (µS/cm)
- Turbidity (Nephelometric Turbidity Unit (NTU)) and
- pH (pH units).

Water samples are to be collected for the following analyses:

- Carbonaceous biochemical oxygen demand (cBOD) (g O_2/m³);
- Escherichia coli (MPN/100 mL);
- Total Ammoniacal-N (mg/L);
- Nitrite-N (mg/L);
- Nitrate-N (mg/L);

D R A F T

- Nitrate-N + Nitrite-N (mg/L);
- Dissolved Reactive Phosphorus (DRP) (mg/L);
- UV fluorescence indicative of Fluorescent Whitening Agents (FWA)

Water quality data can be compared to the National Policy Statement for Freshwater Management (NPS-FM) (2020) Attribute Bands, and the Australian and New Zealand Guidelines for Fresh and Marine Water Quality guidelines (ANZG, 2018a; ANZG, 2018b). These parameters are useful to explain ecological effects such as any changes in physical habitat suitability, changes in community structures, behavioural changes or reduced quantities of fin fish and shellfish, and/or increase in nuisance plants or algae blooms (Table 1-5).

Continuous water quality monitoring sensors were deployed during the pilot study and proved useful for capturing information at the time of overflows and overall temporal trends. However, the sensors were not always valuable in relation to non-event based ecological monitoring in already degraded stream systems. Their use is therefore not essential for the purposes of this TMP-F but can support interpretation of results. If deployed, they are to monitor for the same variables as the *in-situ* monitoring outlined above.

2.4.1.3 Sediment analyses

A composite sediment sample is to be collected within the stream thalweg for the following analyses:

- Sediment grain analysis;
- Non-metals and metalloids: Total Recoverable Boron, Total Recoverable Phosphorus, ammonium-N (mg/kg dry wt) and Total Nitrogen (g/100g); and
- Heavy metals: Total recoverable Arsenic, Cadmium, Chromium, Copper, Lead, Nickel, Mercury and Zinc (mg/kg dry wt.).

Heavy metal results can be compared against the ANZG (2018b) for toxicant default guideline values for sediment quality (DGVs). These parameters can help explain ecological effects in relation to physical habitat suitability and community structures, behavioural changes or reduced quantities of freshwater fauna, degradation of aquaculture, loss of suitability for livestock watering or irrigation (Table 1-5).

2.4.2 Biological Indicators

2.4.2.1 Macroinvertebrates

Macroinvertebrate samples are to be collected as per the National Environmental Monitoring Standards (NEMS) for Macroinvertebrates (2022). Samples are to be analysed for:

- Number of taxa – the total number of macroinvertebrate taxa recorded at each site
- Number of individuals – the total number of individual macroinvertebrates recorded at each site;
- %EPT Taxa – Percentage of Ephemeroptera, Plecoptera, Trichoptera (EPT) Taxa;
- MCI/MCI-sb Value – Macroinvertebrate Community Index/(for soft-bottomed streams) (Stark, 1985) and
- QMCI/QMCI-sb Value – Quantitative Macroinvertebrate Community Index/(for soft-bottomed streams) (Stark, 1985).

Three replicates should be collected at each site during the first year of monitoring to build statistical robustness. In the following years, only one sample is sufficient at sites that are repeated from previous years, but any site that has not been monitored previously will require three replicates to be collected. Macroinvertebrate data can be compared to the NPS-FM (2020) Attribute Bands (Table 2-3). Macroinvertebrates are a useful bioindicator of stream health and pollution/nutrient levels (Table 1-5).

D R A F T

Table 2-3 Interpretation of MCI and QMCI scores to denote stream health as per NPS-FM attribute bands A, B, C, and D (MfE, 2024)

MCI	QMCI	NPS:FM Attribute Band	Description
≥130	≥6.5	A	Macroinvertebrate community, indicative of pristine conditions with almost no organic pollution or nutrient enrichment.
≥110 and <130	≥5.5 and <6.5	B	Macroinvertebrate community indicative of mild organic pollution or nutrient enrichment. Largely composed of taxa sensitive to organic pollution/nutrient enrichment.
≥90 and <110	≥4.5 and <5.5	C	Macroinvertebrate community indicative of moderate organic pollution or nutrient enrichment. There is a mix of taxa sensitive and insensitive to organic pollution/nutrient enrichment.
<90	<4.5	D	Macroinvertebrate community indicative of severe organic pollution or nutrient enrichment. Communities are largely composed of taxa insensitive to inorganic pollution/nutrient enrichment.

2.4.2.2 Diatoms

Diatom samples are to be collected from a representative range of substrates within each site including hard surfaces (e.g. rocks, cobbles) and aquatic macrophytes. Similar to macroinvertebrate sampling, three replicates of diatoms must be collected at all sites when monitored for the first time as part of this monitoring plan, which can then be reduced down to one sample when re-monitored Diatom community assemblages should be analysed for:

- Percentage Pollution Tolerant Valves (%PTV); and
- Specific Pollution Sensitivity Index (SPI).

The %PTV index is derived from the UK Trophic Diatom Index (TDI) developed by Kelly & Whitton (1995), and is specifically designed to detect organic pollution, particularly from sewage outfalls and elevated orthophosphate-phosphorus concentrations. This index does not provide a comprehensive measure of general stream quality but is effective for identifying organic enrichment impacts. A score of 0 indicates no organic pollution, and a score of 100 indicates definite and severe organic pollution (Table 2-4).

Table 2-4 Interpretation of the percentage Pollution Tolerant Valves scores (adapted from Kelly, 1998)

%PTV	Interpretation	Descriptor
< 20	Site free from organic pollution	Good
20 to < 40	There is some evidence of organic pollution	Moderate
40 to 60	Organic pollution likely to contribute significantly to eutrophication	Poor
> 60	Site is heavily contaminated with organic pollution	Bad

SPI is a widely used diatom index developed to assess general water quality, particularly in relation to nutrient enrichment and organic pollution. It integrates species-specific sensitivity values and ecological preferences to produce a continuous score reflecting the overall ecological status of a site. Higher SPI scores indicate better water quality, and lower SPI scores indicate degraded conditions (Table 2-5).

D R A F T

Table 2-5 Interpretation of the Specific Pollution Sensitivity Index (Adapted from Eloranta & Soininen, 2002; Harding & Taylor, 2011)

Index Score (SPI Score)	Ecological Category	Descriptor
>17.3	A	High Quality
16.8-17.2	A/B	
13.3-16.7	B	Good Quality
12.9-13.2	B/C	
9.2-12.8	C	Moderate Quality
8.9-9.1	C/D	
5.3-8.8	D	Poor Quality
4.8-5.2	D/E	
<4.8	E	Bad Quality

2.4.2.3 Periphyton (RAM-1)

Periphyton abundance will be monitored using the Rapid Assessment Method 1 (RAM-1) as detailed Biggs & Killroy (2000). Mean % periphyton cover should be estimated and compared against the New Zelaand Peiphyton Guideline (MfE, 2000) aesthetic impact guideline for identifying nuisance filamentous periphyton (≥30%). Note that this guideline is for aesthetic impact, rather than ecological impact (results were inconclusive in the pilot study), but is still useful in assessing the ecological effect of increase in nuisance plants and/or diatom mats, which is an effect mentioned in Table 1-5.

2.5 Data analysis

A range of statistical analysis will be undertaken to test the assumptions of Attachment 5 as set out in Section 1.4, which can include but are not limited to:

- The Wilcoxon signed-rank test is useful to evaluate statistical differences between upstream and downstream sites and determine if any differences can be attributed to wastewater overflows.
- Spearman rank correlation allows statistical analysis to be undertaken between physical/physicochemical parameters and ecological indicators and does not assume normality. The analysis provided is robust to non-linear but monotonic relationships and is appropriate for datasets with small sample sizes. A significance threshold of $p < 0.05$ with corresponding correlation coefficients of > +/-0.60 represent statistically significant relationships between parameters.
- Analysis of Variance (ANOVA)/Kruskal-Wallis tests determine statistical differences of means between control and test sites and can be used for macroinvertebrate and diatom results (hence why three replicates are required).

2.6 Integration of datasets

Existing monitoring programmes such as Auckland Council's 'State of the Environment' (SoE) monitoring of streams should be used to supplement the results of this TMP-F. SoE monitoring is undertaken over a 5-year period at selected freshwater sites and provides data on physical, chemical and biological indicators to broadly evaluate stream ecosystem health. SoE monitoring data in locality to monitored EOPs sites and stream catchments should be used to inform the results of TMP-F.

Watercare's datasets obtained from telemetry systems (SCADA) for stream catchments can also provide useful information in assessing cumulative effects, and interpreting results.

Both SoE monitoring and SCADA datasets are able to provide broader baseline data that results can be compared against, while providing higher confidence in the chosen control sites.

D R A F T

3.0 Challenges and Limitations

This TMP-F has been designed to confirm the application of Attachment 5 in relation to an assessment of ecological effects, and its classification of ecological risk in relation to freshwater environments in line with Watercare's NDC. The following limitations are identified below:

- This monitoring plan is not designed for event based monitoring, and instead focuses on assessing the risk of wastewater overflows affecting the ecological health of the receiving environment in the long-term. This takes into consideration best practice methodologies (e.g. for bioindicators that are affected by high flow events) and sampling practicality.
- Not all sites are suitable for the instalment of continuous monitoring sensors, which must be considered during the site selection process.
- The integration of datasets is limited to the location and catchment monitored and therefore useful for general categorisation of ecological stream health within catchments. These data sets may not be applicable to each individual EOP included under this monitoring plan.
- The vast network of underground pipes in Auckland makes it infeasible to monitor many of the EOPs that are piped upstream, of which represent no control site.
- This monitoring plan does not address marine ecological effects nor recreational and public health effects.

Appendix B Ecological Effects Scores

Table 4-1 Scoring of different ecological effects for Small Waterways of Classes 1, 2, and 3 with Low, Medium and High overflow volumes, and overall ecological effect value

		Small Waterways								
		Class 1			Class 2			Class 3		
Overflow Volume		Low	Med	High	Low	Med	High	Low	Med	High
Ecological Effects	Change in physical habitat suitability	5	5	5	4	4	4	2	2	2
	Toxic concentrations of ammonia, sulphide, metals and nitrate	5	5	5	4	4	4	2	2	2
	Change in community structure and/or loss of sensitive species	5	5	5	4	4	4	2	2	2
	Behavioural changes in fin fish	3	4	4	2	3	3	1	1	1
	Increase in nuisance plants, including Ulva(sea lettuce) and diatom mats	2	2	2	1	1	1	1	1	1
	Reduced quantities of fin fish	5	5	5	4	4	4	2	2	2
	Reduced quantities of shellfish	5	5	5	4	4	4	2	2	2
	Loss of suitability for livestock watering	5	5	5	5	5	5	5	5	5
	Loss of suitability for irrigation use	5	5	5	5	5	5	5	5	5
	Growth of sewage fungus and/or Beggiatoa	4	5	5	3	4	4	1	2	2
Overall ecological effect		**VH**	**VH**	**VH**	**H**	**H**	**H**	**L**	**L**	**L**

Scores correspond to: 5 = Very High, 4 = High, 3 = Moderate, 2 = Low, 1 = Very Low

Overall ecological effect: VH = Very High, H = High, M = Moderate, L = Low, VL = Very Low

D R A F T

Table 4-2 Scoring of different ecological effects for Large Waterways of Classes 1, 2, and 3 with Low, Medium and High overflow volumes, and overall ecological effect value

		Large Waterways								
		Class 1			Class 2			Class 3		
Overflow Volume		Low	Med	High	Low	Med	High	Low	Med	High
Ecological Effects	Change in physical habitat suitability	2	3	3	1	2	2	1	1	1
	Toxic concentrations of ammonia, sulphide, metals and nitrate	3	3	3	2	2	2	1	1	1
	Change in community structure and/or loss of sensitive species	3	3	3	2	2	2	1	1	1
	Behavioural changes in fin fish	2	3	3	1	2	2	1	1	1
	Increase in nuisance plants, including Ulva(sea lettuce) and diatom mats	2	2	2	1	1	1	1	1	1
	Reduced quantities of fin fish	3	3	3	2	2	2	1	1	1
	Reduced quantities of shellfish	3	3	3	2	2	2	1	1	1
	Loss of suitability for livestock watering	3	5	5	3	5	5	3	5	5
	Loss of suitability for irrigation use	3	5	5	3	5	5	3	5	5

1 Introduction

This report presents a Draft Targeted Monitoring Programme (TMP) to assess the impact and ecological effects from Watercare Services Ltd's wastewater network overflow discharges to marine receiving environments within Auckland. This work has been undertaken in accordance with our agreed contract dated 24 April 2026.

1.1 Background

Watercare Services Ltd ('Watercare') operate wastewater networks throughout the Auckland Region, including satellite towns such as Wellsford to the north and Waiuku to the south. Watercare hold resource consent R/REG/2013/3755 known as Watercare's Auckland Wastewater Network Comprehensive Discharge Permits – the Auckland-Wide Network Discharge Consent (hereafter the NDC) that authorises discharges from network overflows as a result of blockages or when surcharging occurs. The NDC was granted in June 2014.

A Draft TMP for the marine receiving environment has been developed to support compliance with NDC Conditions. The Draft TMP has undergone several stages of development since its inception. The original framework was developed by NIWA in 2015 and approved by Auckland Council (AC) in June 2015. A cost-optimised revision prepared in 2016 was subsequently approved in November 2016. Initial monitoring focused on water quality and ecological sampling across three catchments but produced inconclusive outcomes due to limited temporal coverage and inconsistent event capture (Watercare, 2025).

In response to the limitations of the previous sampling, Watercare commissioned a workshop in June 2024 between Watercare, AECOM and Tonkin & Taylor Ltd (T+T) staff to develop a Pilot Monitoring Programme for the TMP. The aim of the Pilot, and subsequently the Draft TMP presented here, is to assess receiving environment ecological state over time in response to discharges from Engineered Overflow Points (EOPs) for a minimum of three years but no more than five years.

In summary, the Pilot monitoring plan covered three receiving environment types including basins, beaches and estuaries within the marine environment. Six sites across central Auckland were monitored in summer and winter for one year with survey methods including sediment quality and benthic ecology sampling to capture data to inform key biological indices. These Pilot monitoring data were subject to a detailed statistically analysis (data investigations) of the effects of wastewater discharges on marine benthic ecological health.

The outcomes of the Pilot monitoring data investigations are presented in a separate report (T+T, 2026) that has informed and should be read in conjunction with this Draft TMP. An overview of the Pilot monitoring programme and data investigations is provided in Section 2.

1.2 Report scope

The scope of the Draft TMP is to meet requirements of Attachment 5 and conditions 58 and 61 of Watercare's NDC (Table 1.1 below). The data collected for the Pilot has formed the first year of data collection as part of the three-year programme. This Draft TMP presents the methodology to be implemented in 2027 and 2028 at which point the requirement for ongoing monitoring will be reviewed.

Table 1.1: NDC Recreational and Ecological Effect consent conditions

Consent number	Consent condition
58	The Consent Holder shall undertake a targeted monitoring programme with the objective of confirming that the application of the Methodology for the Assessment of Effects of Wet Weather Wastewater Overflows in **Attachment 5** results in an appropriate assessment of recreational, public health and ecological effects.
61	The scope, methodology and timing shall include: a A methodology for collecting appropriate data on wastewater overflows, their characteristics and the changes (if any) caused in identified receiving environments. b A methodology for analysing the data collected to ensure that the results are capable of achieving the targeted monitoring programme's objective. c A description of how the monitoring design will take account of and integrate data from existing monitoring programme undertaken by third parties (if any) to support spatial and temporal trend analysis and assessing the influence of other factors (not related to wastewater overflows). d The expected timeframe over which the monitoring programme will be undertaken to achieve its objective, which must be a minimum of three years duration but not exceeding five years duration.

2 Pilot monitoring programme and data investigation overview

Data collection for the Pilot monitoring programme was undertaken in 2025. Data were reported and analysed in a detailed "data investigations report" (T+T, 2026). This section provides an overview of the Pilot monitoring and data investigation outcomes as context to the Draft TMP.

2.1 Pilot monitoring overview

The Pilot TMP programme was developed by way of a workshop with T+T and AECOM. The Pilot included six coastal receiving environments including Hobson Bay, Judges Bay, Curren Street, Cox's Bay, Motions Creek and Waterview. These were monitored in summer and winter 2025, covering estuarine mudflats, beaches and sheltered basins. The sampling regime included benthic macrofauna, redox potential discontinuity (RPD), sediment grain size, nutrients, heavy metals, fluorescent whitening agents (FWAs), and pharmaceuticals and personal care products (PPCPs).

The results of the Pilot monitoring were presented in T+T (2026). Clear spatial patterns were observed. Motions Creek and Cox's Bay sites showed elevated concentrations of metals (copper, zinc, cadmium, chromium) and higher levels of FWAs and PPCPs, indicating consistent wastewater and stormwater influence. The Waterview site exhibited moderate levels of contamination. The Judges Bay site displayed elevated lead and mercury, while Hobson Bay had the lowest overall contaminant load. Benthic macrofauna diversity was highest at the Curran Street site and Judges Bay and lowest at Motions Creek and Waterview. Overall, the Pilot indicated that the selected sites captured a gradient of ecological condition and potential wastewater exposure.

2.2 Data investigation summary

To identify the drivers of wastewater influence on benthic biological health of the marine environment, a focused investigation of data collected from the 2025 Pilot was analysed against wastewater overflow and event datasets provided by Watercare and other AC benthic ecology and sediment quality monitoring sites (T+T, 2026). This analysis helped to inform the identification of preferred monitoring parameters and site locations which will provide an indication of the potential impacts from wastewater discharges across Auckland. The investigation also included a critical analysis of the application of the Attachment 5 process from a marine receiving environment monitoring perspective.

This analysis is provided in a supplementary report and key points with respect to this Draft TMP are summarised below.

2.2.1 Statistical analysis overview

A weight-of-evidence approach was applied to integrate multiple lines of evidence and assess the extent to which wastewater-related indicators are linked to observed benthic ecological responses. The weight-of-evidence assessment indicated that wastewater-related indicators contributed to observed ecological patterns but were not the primary drivers of benthic condition across the 2025 TMP sites. Macrofaunal community structure and ecological health, as measured by AMBI and Metals BHM, were most strongly influenced by sediment grain size, organic enrichment and metal contamination.

A "wastewater exposure metric" was developed based on Watercare data sets in order to contextualise observed sediment quality and benthic ecology for each of the monitoring sites and used to explore the Attachment 5 assumptions (see below). The exposure scores generated showed some agreement with wastewater specific indicators (PPCPs and FWAs), are useful for describing broad pressure gradients but have limited ability to predict benthic effects. However, disagreement

with SafeSwim and observed WWO information at some sites means it should be used as a relative exposure ranking only.

2.2.2 Application of monitoring data to assess Attachment 5

The assessment identified that the Pilot TMP monitoring programme provides valuable information for testing the ecological assumptions underpinning Attachment 5. The assessment highlighted key differences in purpose and scale between the individual discharge point focus of Attachment 5 and a receiving environment monitoring site approach. Specifically, Attachment 5 functions as an EOP-based screening tool to assess the potential ecological effects and risks associated with individual overflow points. In contrast, the Pilot TMP monitoring programme evaluates ecological condition at receiving environment sites that may be affected by multiple overflow sources, wet weather discharges, stormwater inputs, and other urban stressors.

Data analysis by T+T (2026), applied Attachment 5 at the monitoring-site scale by grouping multiple EOPs and aggregating risk-related inputs, identifying some uncertainty where discharge pathways and receiving-environment classifications set up in the existing Attachment 5 framework were broad or inconsistent. The assessment also identified that several Attachment 5 inputs, including SEA overlays and discharge modelling data would benefit from updating (T+T, 2026).

Overall, Attachment 5 remains a useful screening and prioritisation tool, but its application to ecological monitoring would benefit from further refinement to improve its predictive value. The data investigation report makes several recommendations for improvement that can be refined over the course of the TMP implementation and as more data are gathered (T+T, 2026).

2.2.3 Monitoring sites

The data investigation report included an exercise to identify additional sites for inclusion in the TMP, considering the outcomes of the above analysis, focusing on existing state of the environment sites and attempting to improve site coverage with respect to Attachment 5 parameters.

The report recommended to continue with the six monitoring sites that were monitored in the 2025 Pilot TMP (Hobson Bay, Judges Bay, Curran Street, Cox's Bay, Motions Creek, Waterview) as priority sites, and with the addition of four further priority sites that balance the need for high ecological risk categories, a range of overflow volumes, sufficient exposed habitat to sample and a range of receiving environments. These sites include Tāmaki Estuary, Henderson Lower, Meola Inner, Mahurangi (Edwards Rd).

To help understand the potential impacts from wastewater overflow pressure to marine ecological health, the data investigation report also recommended four references sites which align with AC State of the Environment (SoE) monitored sites for inclusion. The selected sites are comparable in concentrations to 2025 Pilot TMP monitored site results in terms of mud and metal profiles and are sites where minimal wastewater exposure is recorded (T+T, 2026).

The AC SoE monitoring sites selected as potential reference sites for the Draft TMP include Mid Harbour, Central Main, Herald Island North and Brigham Creek, all of which were sampled in the AC SoE programme in 2025. The AC data does provide a long-term record for these sites, contributing to an understanding of ecological health and trends over time.

2.3 Monitoring parameters

The monitoring parameter suite sampled for the 2025 Pilot TMP was selected based on recommendations from the NIWA's proposal for TMP and through an expert workshop with T+T and AECOM (Table 2.1) (T+T, 2024).

The following monitoring programme parameters were selected for the 2025 Pilot TMP and monitored over a summer and winter sampling round:

- Macrofaunal cores
- Sediment samples
  - Metals (Arsenic, Cadmium, Chromium, Copper, Nickel, Lead, Zinc and Mercury)
  - Nutrients (Total organic carbon, Total nitrogen, Total phosphorus, Ammonia)
  - Phytoplankton biomass indicators: Chlorophyll *a* and Pheophytin
  - Grain size analysis (7 grain size profile)
  - Fluorescent Whitening Agents (FWAS)
  - Pharmaceutical and Personal Care Products (PPCPs)
- Visual assessment of nuisance plants (diatom mats, macroalgae coverage)

Table 2.1: NIWA suggested parameters for potential physical, chemical and biological changes for marine ecological effects

Change/effect	Monitoring parameter	Estuaries	Beach	2025 Pilot TMP
Short-term				
Wastewater specific tracers	Collect water samples for PPCPs and FWAs	✓	✓	
Change in benthic macrofauna community structure	Quantitative sampling, examine differences in abundance and species composition	✓	✓	
Reduced quantities of shellfish	Quantitative sampling, examine differences in abundance	✓	✓	
Increase in nuisance plants	Visual assessments of diatom mats	✓		
Growth of Beggiatoa	Visual assessment of Beggiatoa coverage and biomass		✓	
Long-term				
Nutrient and organic enrichment of sediment	Collect sediment samples for TOC, TN and TP measurement	✓	✓	✓
Metal accumulation in sediments	Collect sediment samples for metals	✓		✓
Wastewater specific tracers	Collect sediment samples for analysis of PPCPs and FWAs	✓	✓	✓
Increase in nuisance plants	Visual assessment of diatom mats	✓	✓	✓
Change in physical habitat suitability	Examine physical habitats, including collect sediments for grain size analysis	✓	✓	✓
Change in benthic macrofauna community structure	Quantitative sampling, examine differences in abundance and species composition	✓	✓	✓
Reduced quantities of shellfish	Quantitative sampling, examine differences in abundance and size	✓	✓	

Change/effect	Monitoring parameter	Estuaries	Beach	2025 Pilot TMP
Growth of Beggiatoa	Visual assessment of Beggiatoa coverage and biomass	✓	✓	

Based on the findings from the data investigations (T+T, 2026), this Draft TMP has adopted a targeted and integrated indicator suite.

Statistical analysis found that PPCP's and FWAs were significantly associated with community structure, but their independent contribution was relatively small and partly shared with co-stressors. PPCPs provided contaminant-specific confirmation of wastewater influence; however, the Pilot dataset did not demonstrate sufficient additional ecological explanatory or management value to justify routine ongoing PPCP sampling, particularly because no PPCP-specific ecological thresholds or management trigger values are available for sediment concentrations.

FWAs identified broad spatial differences in relative wastewater influence and are therefore suitable as the primary wastewater-specific tracer for future trend monitoring. PPCPs should be reserved for periodic validation or targeted investigations where contaminant-specific resolution is required.

AMBI, Metals BHM, Mud BHM, and key sediment, organic and metal variables should remain the core ecological interpretation framework.

3 TMP methodology

This section presents the proposed methodology for the Draft TMP including site locations, field data collection and data analysis.

As the 2025 Pilot data forms year one of the data collection, data will be collected for a minimum of two additional years, 2027 and 2028. A three-year review will then be undertaken to inform decisions regarding any further monitoring.

3.1 Existing monitoring programme integration

Consent condition 61c requires the TMP to "*integrate data from existing monitoring programmes undertaken by third parties (if any) to support spatial and temporal trend analysis and assessing the influence of other factors (not related to wastewater overflows)*".

AC's SoE monitoring programme is designed to track the condition and identify long-term trends of Auckland's natural environment through marine monitoring programmes including sediment contaminant, soft sediment and rocky reef ecology and water quality. These programmes involve monitoring at intervals which may be monthly (such as the water quality), bi-monthly (some soft sediment ecology sites) or on a rotational basis (sediment contaminant and other soft sediment and rocky reef ecology sites). The monitoring is designed to identify changes in the health of the marine environment in response to multiple stressors, which include wet weather wastewater discharges.

The sampling methodology used by AC for marine monitoring (macroinvertebrate cores and sediment samples) has been adopted in this Draft TMP to ensure that the way the samples are collected allows for the comparison of results between the TMP and AC SoE monitoring (Auckland Regional Council, 2004; Carbines et al., 2013; Mills and Allen, 2021; Drylie, 2021).

The data investigation report (T+T, 2026) identified four AC sites to be used as reference sites due to their compatibility with 2025 Pilot TMP monitored sites with muds and metals within sediment. These have been adopted for the Draft TMP.

We have reviewed the selected AC monitoring sites for potential data integration and efficiencies (see Appendix A). AC's SoE monitoring programmes provide potentially usable macrofauna, sediment grain size and contaminant data for TMP monitoring; however, differences in sampling timing and frequency mean that alignment is limited. Of the four TMP reference sites, only Herald Island North and Mid Harbour (Mahurangi) align sufficiently with AC ecology monitoring to potentially use AC data during 2027–2029, subject to annual confirmation of monitoring schedules and timely data availability.

3.2 TMP sites

Draft TMP sites are included in Table 3.1. GPS locations for the four new priority sites (highlighted in blue) will be collected during the summer 2027 monitoring round.

Table 3.1: Draft TMP monitoring sites

Proposed monitoring sites	Receiving environment type	Site establishment	Site type	GPS coordinate (sample location 1)	
				NZTM Easting	NZTM Northing
Hobson Bay	Basin	2025	Priority	1759673	5919228
Judges Bay	Basin	2025	Priority	1759531	5920312

Proposed monitoring sites	Receiving environment type	Site establishment	Site type	GPS coordinate (sample location 1)	
				NZTM Easting	NZTM Northing
Curran Street	Beach	2025	Priority	1755072	5921515
Cox's Bay	Beach	2025	Priority	1753765	5920387
Motions Creek	Estuaries	2025	Priority	1752663	5919589
Waterview	Estuaries	2025	Priority	1751066	5917833
Tāmaki Estuary	Estuaries	New	Priority	TBC	TBC
Henderson Lower	Estuaries	New	Priority	TBC	TBC
Meola Inner	Estuaries	New	Priority	TBC	TBC
Mahurangi (Edwards Rd)	Estuaries	New	Priority	TBC	TBC
Brigham Creek (Upper Waitematā)	Estuaries	New	Potential reference site	1743254	5928631
Central Main (Upper Waitematā)	Harbour**	New	Potential reference site	1746577	5929329
Herald Island North (Upper Waitematā)	Harbour**	New	Potential reference site	1747994	5928628
Mid Harbour (Mahurangi)	Estuary	New	Potential reference site	1754969	5964505

Note: **these sites were closely aligned with mud and metal profiles similar to those of TMP sites (Curran Street, Judges Bay and Cox's Bay) and with low wastewater exposure as a priority over the receiving environment type.

3.3 Monitoring frequency

To capture seasonal differences, monitoring should be undertaken twice per year, once during winter (June to August) and once during summer (December to February), over a minimum of a three-year period required under consent condition 61d.

We note that project specific monitoring of reference sites is required to meet the timeframes of the Draft TMP, and in only some instances can rely on AC monitoring (refer to Appendix A).

3.4 Site observations

Prior to the commencement of works at each site the following attributes will be recorded:

- Weather conditions
- Site conditions including any visible discharges
- Site characteristics (with photos obtained)
- Visual assessment of the presence of nuisance algae such as *Ulva*, *Gracillaria* or Beggiatoa.

3.5 Benthic ecology sampling

Benthic community structure will be assessed by monitoring the benthic invertebrate community, including both epifauna and infauna assessment and sampling.

Sampling procedures will follow AC monitoring methodology (Auckland Regional Council, 2004; Drylie, 2021). Two 50 m long transect lines are to be laid using transect tapes approximately 10 m apart, with the sample plot extending ca. 5 m each side of the ends of the transect lines to create a 6,000 – 9,000 m² sample plot. Six sampling locations will be positioned alternately on either side of

the laneways, two at each end of the transects and two at the 25 m mark as seen in Figure 3.1. GPS coordinates will be recorded at both ends of the tape to enable site relocation for future monitoring.

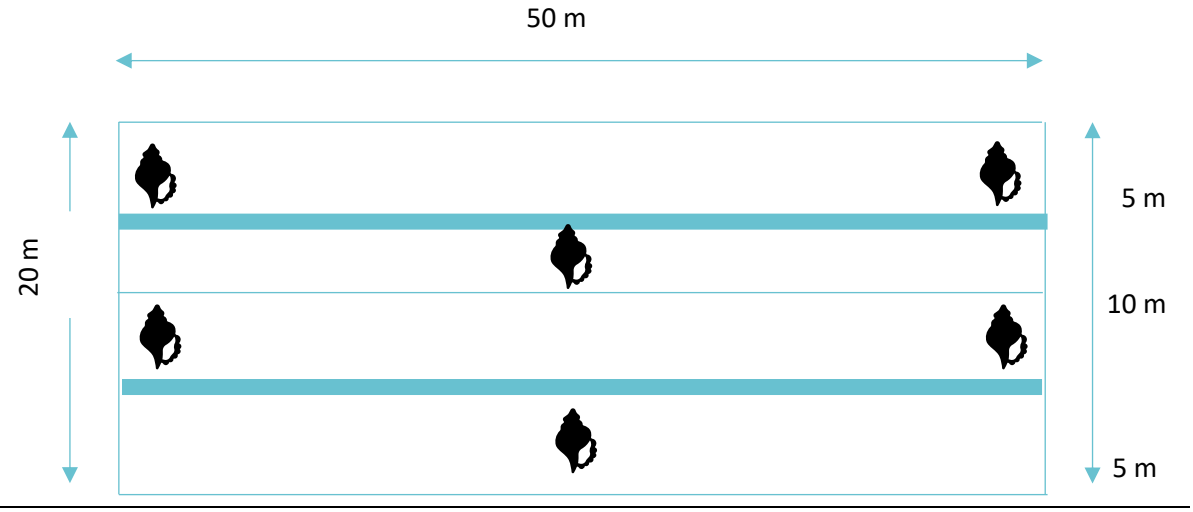

Figure 3.1 Benthic ecology sample design. Seashells indicate the location of each sampling point.

3.5.1 Benthic epifauna assessment

At each sampling point as specified in Figure 3.1 a 0.25 m^2 quadrat will be placed and all organisms on the surface of the sediment within the quadrat identified and recorded. A photograph of each quadrat will be taken for future reference purposes.

3.5.2 Benthic infaunal samples

To characterise benthic invertebrate communities, one core sample will be taken from each sampling location. Each core should be collected using a single, circular corer of 13 cm diameter by 15 cm deep. The corer is manually driven into the sediment and removed with core contents intact and transferred to a bag for subsequent sieving. All core samples are to be sieved using a 500 µm mesh sieve either on site or at an appropriate location and remaining organisms preserved in 90% ethanol. Samples will be sent to BioLive Invertebrate Identification Services (Nelson) (or equivalent laboratory provider) for processing and species identification.

3.5.3 Redox potential discontinuity

At each sampling location, an additional core will be obtained using a transparent plastic corer designed to open for visual inspection. This allows for the identification of the redox potential discontinuity (RPD) within the upper 300 mm of sediment. The depth of the RPD is to be measured and documented.

3.6 Sediment sampling

Sediment quality sampling will be undertaken at each site. With reference to AC sampling methods (Allen, 2024), a composite sample will be collected by collecting a small amount of sediment from the top 2 cm of the sediment at each site into a sample jar. Sediment samples are to be analysed by an accredited laboratory for the following:

- Heavy metals (Arsenic, Cadmium, Chromium, Copper, Nickel, Lead, Zinc and Mercury).
- Nutrients (Total organic carbon - TOC, Total nitrogen - TN, Total recoverable phosphorus TRP, Ammonia).

- Phytoplankton biomass indicators: Chlorophyll *a* and Pheophytin.
- Grain size analysis (7 grain size profile).
- Fluorescent Whitening Agents (FWAS).

Three replicate composite samples will be collected at each site for both heavy metals and nutrients, while all other parameters should be analysed from a single composite sample at each site.

Analysis of sediment samples should be undertaken by an accredited lab such as Hills Labs (for heavy metals, nutrients and grain size analysis), Earth Sciences New Zealand (Chlorophyll *a* and pheophytin), PHF Science (New Zealand Institute for Public Health and Forensic Science - formerly ESR – The Institute of Environmental Science and Research) for FWAs.

The lab analysis carried out by PHF Science for FWAs should be set up to detect FWAS #1 (Disodium 4,4'-bis[(4-anilino-6-morpholino-1,3,4-triazin-2-yl)amino]stilbene2,2'-disulphonate) and reports concentrations to the reporting limit of <0.01 ppb), tested by ultra-High Performance Liquid Chromatography (uHPLC). This testing provides results for the concentration of fluorescent whitener #1 in the dried sediment (ppb=µg/kg).

The lab used needs to be accredited to ISO-17025 standards and benchmarked using Proficiency Evaluation (PE) studies as available.

3.7 Data analysis

Analysis of the sediment sample data will include comparison against known standard guidelines, where available, each year to assess sediment quality conditions, including changes over time.

Benthic invertebrate and benthic health metrics will be calculated after each year that benthic data are collected to monitor change or continuity through time.

The following sections specify the required data analysis.

3.7.1 Grain size analysis

Sediment samples will be analysed by an accredited lab such as Hills Laboratories for 7 grain size classes (Gravel ≥ 2 mm; Very Coarse Sand 1 mm to < 2 mm; Coarse Sand 500 µm to < 1 mm; Medium Sand 250 µm to < 500 µm; Fine Sand 125 µm to < 250 µm; Very Fine Sand 63 µm to < 125 µm; Mud (Silt + Clay) < 63 µm).

The grain size analysis looks at the percentage of 'muddiness' and assesses these against the AC classes specified within the sediment monitoring protocols. The split of the classes relates to the amount of mud grain size < 63 µm and is specified as those below (Drylie, 2021):

- Excellent < 10 %
- Good 10 – 25 %
- Fair 25 – 60 %
- Marginal 60 – 80 %
- Poor > 80 %

3.7.2 Metals

To assess the potential ecological risk posed by sediment contamination, contaminant concentrations will be compared against established sediment quality guidelines (SQGs). These guidelines provide thresholds that indicate the likelihood of adverse effects on benthic organisms residing in the sediment.

Three main SQG frameworks are used in Auckland, the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018), Environmental Response Criteria (ERC) and Threshold Effects Level (TEL) and Probable Effects Level (PEL) values.

The ANZG are to be applied to all metal analytes. These guidelines include Default Guideline Values (DGVs), which represent concentrations below which adverse ecological effects are unlikely and upper guidelines (GV-high), above which toxic effects may be expected (Allen, 2024).

For copper, lead and zinc, the ERC guidelines developed by Auckland Regional Council (ARC, 2004) should be used. The ERC guidelines are region-specific and more conservative than the ANZG values, designed to provide early warnings to environmental degradation specifically within Auckland habitats. The ERC categorises contaminant levels into three bands:

- Green: low impact, minimal ecological risk.
- Amber: moderate impact, potential early signs of ecological stress.
- Red: high impact, likely ecological degradation.

For chromium, mercury, cadmium and nickel, the TEL / PEL values from MacDonald et al. (1996) should be applied. The TEL represents concentrations below which adverse effects are rarely observed, while the PEL indicated levels above which adverse effects are frequently observed in benthic communities (Allen, 2024).

These guidelines will be used to classify sediment quality at each site and inform the interpretation of ecological risk. These specified threshold values to be applied are presented in Table 3.2.

Table 3.2: Environmental Response Criteria (ERC), Threshold Effects Level / Probable Effects Level (TEL / PEL), and Australian and New Zealand Guidelines (ANZG) for metals. DGV = default guideline values, GV-High = guidelines value high (Allen, 2024)

	ERC (mg/kg)			ANZG (mg/kg)			TEL/PEL (mg/kg)		
Metals	Green	Amber	Red	DGV		GV-high	TEL		PEL
Copper	<19	19 - 34	>34	<65	65 - 270	>270	Not applicable		
Lead	<30	30 - 50	>50	<50	50 - 220	>220	Not applicable		
Zinc	<124	124 - 150	>150	<200	200 - 410	>410	Not applicable		
Arsenic	No ERC values			<20	20 - 70	>70	Not applicable		
Chromium	No ERC values			<80	80 - 370	>370	<52.3	52.3 - 160	>160
Mercury	No ERC values			<0.15	0.15 - 1	>1	<0.13	0.13 - 0.7	>0.7
Cadmium	No ERC values			<1.5	1.5 - 10	>10	<0.68	0.68 - 4.21	>4.21
Nickel	No ERC values			<21	21 - 52	>52	<15.9	15.9 - 42.8	>42.8
Silver	No ERC values			<1	1 - 4	>4	<0.73	0.73 - 1.77	>1.77

3.7.3 Nutrients

Sediment nutrient and total organic carbon (TOC) data will be analysed to provide context on benthic ecological condition and potential eutrophication risk. The assessment will examine nutrient concentrations and TOC levels, recognising that finer, muddier sediments typically retain higher nutrient loads and may influence nutrient enrichment patterns. TOC results will be compared against established condition thresholds, including reference conditions (<0.5% TOC) and degradation thresholds (approximately 1.2 – 3.5% TOC), to evaluate the extent of organic enrichment. The findings will then be interpreted alongside sediment characteristics and other ecological indicators to assess sediment condition, potential eutrophication effects, and overall benthic health.

Banding thresholds developed are aligned with national policy and Estuary Trophic Index (ETI) scoring systems to assess sediment condition and eutrophication risk (Stevens et al., 2024) (Table 3.3).

Table 3.3: Recommended % TOC thresholds in marine sediment

% TOC	Ecological Quality Status			
	Very Good (A)	**Good (B)**	**Fair (C)**	**Poor (D)**
	<0.5%	0.5 to 1.2%	>1.2% to 2%	>2%
Narrative	No to minor stress on sensitive organisms.	Moderate stress on some species and a risk of sensitive macroinvertebrate species being lost.	Significant, persistent stress on a wide range of aquatic organisms.	A likelihood of local extinctions of keystone species and loss of ecological integrity.

Sediment total nitrogen (TN) is a supporting indicator of estuarine health, used alongside other metrics like TOC, and macrofauna indices. Studies, including Sutula et al. (2014) and Robertson et al. (2016), propose thresholds for TN content, from < 250 mg/kg rated 'Very good' to > 2000 mg/kg 'Poor' (Table 3.4). TN influences benthic habitat quality, with impacts evident in macrofauna richness and abundance. Strong correlations exist between TN, TOC, and mud content. While spatial thresholds remain unvalidated, recent data from Salt Ecology and others reinforce TN's role in eutrophication assessment, especially when integrated with other indicators to reflect ecological condition and degradation (Stevens, et al. 2024).

Table 3.4: Recommended thresholds for total nitrogen (TN) in marine sediment.

TN (mg/kg)	Ecological Quality Status				
	Very Good	**Good**	**Fair**	**Poor**	**Very Poor**
	<250	≥250 to <800	≥800 to <1200	≥1200 to <2000	≥2000
Narrative	Sediments are well oxygenated and ecological communities are health and resilient.	Sediments are well oxygenated and ecological communities are at low risk of losing sensitive species.	Ecological communities are at moderate risk of losing sensitive species.	Likely decrease in sediment oxygenation. Ecological communities are at high risk of a shift in macrofauna community to more tolerant species.	Poor sediment oxygenation. Ecological communities likely comprise eutrophication tolerant species.

Total phosphorus (TP) is correlated with several sediment characteristics (grainsize, TOC, TN) but the relationship to sediment health indicators can be variable, which does not make TP a suitable indicator for estuarine health. At present there is insufficient information available to set thresholds for TP.

3.7.4 Benthic invertebrates

Shannon-Weiner diversity and evenness index values will be calculated for each benthic invertebrate core. These indices produce a single number to describe different types and abundances of species present in a community and provide a measure of biodiversity[1].

3.7.5 Benthic Health Model (BHM)

The Benthic Health Model (BHM) will be used to estimate an overall benthic health status. The BHM is a standardised, national-scale tool used to assess estuary health in Aotearoa New Zealand, based on the composition and abundance of benthic macrofauna. It uses multivariate models to translate community structure into a score (from 1 to 6) that reflects the relative impact of key stressors—specifically sedimentation (Mud BHM) and heavy metal contamination (Metals BHM) on ecological integrity, with higher scores indicating more impact (Table 3.5) (Clark, 2025). Rather than relying on fixed reference conditions, the models evaluate sites along stressor gradients observed across many estuaries, allowing comparison to sites nationally. Table 3.6 presents the absolute health boundaries in which BHM Metal scores may fall. To calculate the BHM the groomed data should be entered into National BHM Script 2025[2] which is run by PRIMER Version 8 for each of the sites. It is recommended to assess the absolute health as well as relative impact when applying the Metals BHM (Table 3.5 and Table 3.6).

Table 3.5 Descriptive names and boundaries for National Benthic Health Model (BHM) score categories (Clark, 2025)

BHM group	Level of impact relative to other estuarine sites in Aotearoa New Zealand*	BHM score
1	Very low	1.0 to < 2.0
2	Low	2.0 to < 3.0
3	Moderate	3.0 to < 4.0
4	High	4.0 to < 5.0
5	Very high	≥ 5.0

*This is a relative measure of impact rather than an absolute measure of health.

Table 3.6: Absolute health boundaries for the National Metals Benthic Health Model (Metals BHM) (Clark, 2025).

Absolute health	Metals BHM score
Good	Less than 3.6
Fair	3.6 to < 4.8
Poor	4.8 or greater

3.7.6 AZTI Marine Biotic Index (AMBI)

The AZTI Marine Biotic Index (AMBI) was developed to assess environmental stress or the degree of disturbance occurring within a marine environment, based on the benthic communities present

[1] The diversity value (H') ranges between 0 (low diversity or complexity among species) and 5 (high diversity), while evenness (E) ranges from 0 (high abundances of a low number of species) to 1 (equal abundances across a range of species).

[2] BHM script is requested from Cawthron to ensure correct processing and up to date modelled data is used.

(Borja et al., 2000). The AMBI system categorises taxa into “Ecological groups” (EGs), based on taxon-specific sensitivities to anthropogenic and natural disturbances (e.g. organic enrichment, increasing mud content (sedimentation) and pollutants (e.g. heavy metal)). Broadly speaking, this index gives an indication of the ecological health of an intertidal/subtidal marine environment but is not specific to any one type of disturbance.

AMBI disturbance classes should be assigned following Borja et al. (2000): Undisturbed (< 1.2), Slightly disturbed (1.2 – 3.3), Moderately disturbed (3.3 – 4.3), Heavily disturbed (4.3 – 5.0), and Extremely disturbed (≥ 5.0). The AMBI offers a ‘disturbance or pollution classification’ of a site, representing benthic community health (Muxika et al., 2005). AMBI scores should be calculated using AMBI software and the most recent species list (October 2024) for each of the TMP monitoring sites.

4 Programme and reporting

It is proposed to implement the TMP for a minimum period of three years, with the Pilot year representing the first year of the programme. The monitoring set out in this Draft TMP is therefore scheduled to occur in 2027 and 2028.

Detailed reporting was undertaken following the Pilot (T+T, 2026). It is proposed to prepare a data report for the 2027 monitoring year, with a more detailed interpretative report prepared after the completion of the 2028 monitoring.

4.1 2027 data report

A data report will be prepared after the second year (2027) which will be included in annual NDC reporting. The report will include sampling and testing results, the data analysis described in Section 3.7 and high-level commentary on the monitoring metrics and spatial trends.

4.2 2028 three-year review report

A detailed review report will be prepared following the completion of the 2028 monitoring. The three-year review report will include an assessment of all data collected (2025, 2027 and 2028 data).

Data analysis will generally follow the approaches documented in the 2026 data investigations report with more detail on the data analysis provided in 2.2. In summary, the three-year review report will include:

- Analysis of the three years of collected data to identify any trends and evaluate the extent to which observed ecological effects can be attributed to wastewater overflows.
- A review of all data against attachment 5 assumptions and exposure assessments to inform if a further two years, as specified ‘not exceeding five years’ in condition 61 (d) is required to meet the requirements of the consent conditions 58, 59, 60, 61 and 63 of the NDC.
- An assessment of whether the information collected is sufficient to support any refinements or updates to the methodology described in Attachment 5.

5 Applicability

This report has been prepared for the exclusive use of our client Watercare Services Ltd, with respect to the particular brief given to us and it may not be relied upon in other contexts or for any other purpose, or by any person other than our client, without our prior written agreement.

We understand and agree that Auckland Council as the consenting authority will use this report for the purpose of assessing compliance to the NDC.

Appendix A AC monitoring programme integration review

A1 Use of Auckland Council SoE monitoring site data

AC's soft sediment ecology programme collects macrofauna cores and sediment grain size, and the Regional Sediment Contaminant Monitoring Programme (RSCMP) collects information on sediment contaminants. At some TMP sites, there is alignment with AC monitoring sites and data can be utilised where possible.

Ten TMP sites have been chosen based on wastewater exposure characteristics, and four reference sites in close proximity to existing AC SoE sites and information. In the instance where TMP sites are nearby AC SoE sites this provides the potential for the TMP to rely on these data. Following a compilation of AC SoE sites, the associated SoE monitoring programme (i.e. ecology or RSCMP), sampling month and frequency, it was determined that only two of the reference TMP sites could potentially rely on data collected by AC (Table Appendix A.1).

The AC monitoring programmes include core and rotational monitoring sites, with the ecology core sites monitored every year, and the rotational sites in line with the RSCMP monitoring every three or six years. The ecology monitoring programme is completed four times per year (with the month varying dependent on location) and the RSCMP once in October – November.

For the ecology monitoring, the timing aligns for the Upper Waitemata, Central Waitemata and Mahurangi core[3] site monitoring, which includes TMP reference sites Herald Island North (Upper Waitematā) and Mid Harbour (Mahurangi).

Monitoring for Herald Island North is forecast for February, May, August and November each year and at the Mid Harbour (Mahurangi) in January, April, July and November which align with the proposed TMP monitoring in summer and winter in 2027, 2028 and 2029. The other two sites, Brigham Creek and Central Main have no aligning AC SoE monitoring sampling dates and therefore these sites will be included within the TMP monitoring.

To utilise the alignment of the AC SoE and TMP sites, additional communication with AC will need to be undertaken to confirm that the data will be available in a timely manner for reporting and to confirm the potential for in kind collection of an additional FWA samples.

Table Appendix A.1: AC SoE Monitoring sites proposed utilisation of collected data. ** Monitoring sites and frequency are subject to change and should be confirmed with AC annually.

Proposed monitoring site	Receiving Environment Type	SoE Programme	Sample type	Current frequency	Timing	Sample types	Data utilisation
Brigham Creek (Upper Waitematā)	Estuaries	Ecology / RSCMP	Core – RSCMP / Ecology	Every 3 years	October – November	Macrofauna, sediment grain size and sediment contaminants	**None** as sample months and frequencies don't align.

[3] AC have some 44 sites which are part of the core monitoring which is undertaken each year at varying time frames throughout the year. There are additional sites which are part of this programme that are monitored on a rotational time frame.

Proposed monitoring site	Receiving Environment Type	SoE Programme	Sample type	Current frequency	Timing	Sample types	Data utilisation
Central Main (Upper Waitematā)	Harbour	RSCMP	Core – RSCMP / Ecology	Every 3 years	October – November	Macrofauna, sediment grain size and sediment	**None** as sample months and frequencies don't align.
Herald Island North (Upper Waitematā)	Harbour	Ecology	Core – Ecology / RSCMP	Ecology - 4 x year RSCMP – every 6 years	Feb, May, Aug, Nov	Macrofauna, sediment grain size	**Yes** – macrofauna and sediment grain size data available 2027, 2028, 2029. Next RSCMP 2031.
Mid Harbour (Mahurangi)	Estuary	Ecology	Core - Ecology	4 x year	Jan, April, July, Nov	Macrofauna and sediment grain size	**Yes** – macrofauna data available 2027, 2028, 2029

A breakdown of the monitoring programmes for each TMP site and alignment with AC SoE sites is provided below:

- **Hobson Bay** (closest AC site Awatea) – Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the rotational sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Judges Bay** – no corresponding AC site nearby
- **Curran Street** - no corresponding AC site nearby
- **Cox's Bay** (closest AC site Cox's Bay) – Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the core sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Motions Creek** (closest AC site called Motions Creek) - Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the core sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Waterview** (closest AC site Oakley Creek)– Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the core sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Tāmaki Estuary** (AC site Benghazi within the Tāmaki Estuary) - Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the core sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Henderson Lower** (closest AC site Henderson Lower) - Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the core sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Meola Inner** (closest AC site Meola Inner) - Sampling undertaken every six years as part of the RSCMP, next sampling round is in 2029. Ecology is also collected as part of the core sampling programme. Samples are collected in October - November and do not align with TMP frequencies.
- **Mahurangi (Edwards Rd**) - no corresponding AC site nearby

Appendix B Three-year review report data analysis methods

B1 Three-year review report data analysis methods

B1.1 Statistical analysis

After the three years of data collection (2028), results will be statistically analysed using multivariate metrics to understand change or continuity through time.

The purpose of the statistical analysis is to:

1 Investigate and identify any long-term changes in a particular environmental variable (i.e. an increase in FWAS's at a site), which could be related to an overflow event or continual discharge.

2 Investigate if any of the long-term changes in a particular environmental variable has caused a change in ecological community structure or health.

3 Use multivariate analysis to investigate if there are overall differences at sites affected by overflows and if these adhere to the guidance provided in Attachment 5.

4 Use multivariate analysis to investigate and identify the parameters that are driving ecological health and compare these with the AC reference sites.

B1.1.1 Multivariate analysis

Multivariate statistical approaches should be used to analyse the results to understand what the key drivers are of ecological health at each Draft TMP site. All statistical processing should be undertaken using RStudio version 2026.05 software (or equivalent).

B1.1.2 Environmental variables

FWAs should be retained as a separate variable given their distinct source and indicator characteristics.

B1.1.3 nMDS and environmental vectors

Macrofaunal communities sampled at each site across two seasons (summer and winter) should be used to determine community relationships. Community dissimilarity can be quantified using Bray–Curtis distances calculated from raw abundance data. Patterns in community composition should be visualised using two-dimensional non-metric multidimensional scaling (nMDS) implemented in the metaMDS function (vegan package), with 200 random starts to ensure solution stability. Ordination quality should be assessed using the 2D stress value and inspection of Shepard plots, and a three-dimensional solution fitted as a sensitivity check. 75% confidence ellipses are to be used to summarise within-site variation.

Environmental predictors should be assigned to five broad groups for analysis: metals (Arsenic, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Zinc), non-metals/organics (Chlorophyll *a*, Pheophytin, Ammonium, RPD, TN, TOC, TRP), grain size (seven size fractions), and FWAs. These groups represent distinct types of environmental drivers suspected to influence benthic health. Prior to analysis, environmental data collected at the site/season level are to be averaged.

Environmental vectors should be fitted to the nMDS ordination using the envfit function (vegan package; 999 permutations). All variables are to be scaled to zero mean and unit variance prior to

fitting. The strength of association between each independent variable in association with the macrofauna community structure should be assessed by the r^2 statistic, representing the proportion of variance in the nMDS configuration explained by each environmental predictor individually. Statistical significance is determined by permutation test (p-value).

B1.1.4 Variance partitioning

Envfit r^2 does not account for shared variance among environmental predictors, as each variable is assigned independently. Variance partitioning (varpart, vegan package) should be used to quantify the independent and shared contributions of environmental variables, summarised into the four broad groups (metals, non-metals/organics, grain size, and FWAs) in relation to macrofauna community variance.

Two complementary approaches should be used to address the variable count constraint:

- First approach forward selection – A step-by-step method to identify only the variables that make a meaningful, independent contribution ($p \leq 0.05$). These selected variables should be grouped back into their original categories. This approach reduces the risk of including unnecessary variables while retaining the most informative ones from each group.
- Second approach PCA group scores – Each of the four groups will be simplified into a single score using principal components analysis (PCA). The first principal component (PC1) is to be used to represent each group. This reduces every group to one comparable value, regardless of how many variables it originally contained. It allows comparison of group importance on an equal basis and provides a check against the results of the first approach.

Results should be considered in how they explain the variance in macrofaunal communities.

B1.1.5 Biological variables

Mud BHM and Metals BHM outputs should be calculated at the site/season level. AMBI scores are to be calculated at the replicate level and averaged to the site/season level prior to analysis. BHM and AMBI scores should be overlaid on the nMDS ordination using the envfit function (vegan package; 999 permutations). In addition, BHM and AMBI scores should be fitted as continuous environmental vectors using envfit (999 permutations) and as smooth gradient surfaces using ordisurf (vegan package), which fits a generalised additive model (GAM) of index value as a function of nMDS coordinates. The ordisurf R^2 provides an indication of how well each index gradient is represented within the 2D ordination space. In simple terms, this means that nMDS points are to be coloured according to their BHM and AMBI score categories, and a colour gradient applied to the background of the plot to show the spatial change in scores.

Spearman rank correlations should be calculated between BHM and AMBI scores and all environmental variables to identify the physicochemical parameters most strongly associated with each biological index.

B1.2 Comparison to modelled or monitored wastewater exposure

For each of the sites, the current calculated wastewater exposure scores (see Data Investigation Report Sections 3.2, and 4.1.3) should be cross-checked against any updated Watercare data, including where network improvements may have been undertaken to ensure that calculated exposure is still accurate. In addition, there will be flexibility to incorporate or rely on future monitoring information provided by Watercare, such as monitoring data from installed EOP sensors.

B1.3 Application of Attachment 5

The intention of the collection of monitoring data is to analyse results over time and compare against reference sites in a way that identifies potential effects of wastewater to ecology, as outlined in the potential effects table within Step 4 of the data investigations report (T+T, 2026). In summary each potential effect that is applicable to marine receiving environments will require the following to assess against Attachment 5:

- **Change in physical habitat suitability –** assessment of sediment characteristics – combination of elevated FWAs, organic nutrients in sediment. Statistical comparison to reference sites. Qualitative assessment of how environmental variables in the sediment reflect a change in physical habitat have impacted the habitat characteristics and what this means for benthic fauna.
- **Toxic concentrations of ammonia, sulphide, metals and nitrate –** assessment of sediment characteristics – combination of elevated FWAs, organic nutrients in sediment. Statistical comparison to reference sites. Qualitative assessment of how the results of sediment contamination are influenced by expected water column effects, and how this is related to modelled or monitored wastewater exposure.
- **Change in community structure and/or loss of sensitive species –** assessment of benthic macrofauna cores at a community level and in relation to health metrics (BHM and AMBI). Statistical comparison to reference sites. Assessment of epifauna (abundance and diversity). Both benthic macrofauna and epifauna compared to reference sites. Variance partitioning to separate out the effect of wastewater to other key stressors.
- **Behavioural changes in fin fish –** qualitative assessment only, relate the level of degradation at the site with general fish behaviour e.g., is the site toxic, or is the site providing food for fish.
- **Increase in nuisance plants, including Ulva (sea lettuce) and diatom mats –** general observation of vegetation present at the site and within quadrats. Qualitative assessment to relate the level of organic enrichment in the sediment, and the modelled or monitored wastewater exposure scores to the potential for nuisance algal growth to occur.
- **More frequent phytoplankton blooms in the water column –** qualitative assessment only, relate the level of organic enrichment in the sediment, and the modelled or monitored wastewater exposure scores to the potential for phytoplankton blooms to occur.
- **Reduced quantities of fin fish –** qualitative assessment only, relate the level of degradation at the site with general fish behaviour e.g., is the site toxic, or is the site providing food for fish.
- **Reduced quantities of shellfish –** qualitative assessment only, reference to shellfish within epifauna assessment and benthic macrofauna cores.
- **Degradation of aquaculture and/or loss of opportunity for aquaculture –** qualitative assessment only, relating the information on toxicants in the sediment and modelled or monitored wastewater exposure scores to an understanding of suitability for aquaculture.
- **Growth of sewage fungus and/or Beggiatoa –** general observations of sewage fungus and/or Beggiatoa at the site and within quadrats. If either are present, then considered to be caused by wastewater.

Together we create + sustain a better world
